JOB PERFORMANCE REPORT

RESEARCH PROJECT SEGMENT
(Inventory)

State: U T A H

Project Title: Statewide Wildlife Management Inventory

Project No.: W-65-R-34

Job Title: Statewide Upland Game Inventory and Management

Job No.: A-4

Period Covered: December 15, 1984 to April 30, 1986

Abstract: This report includes upland game inventory and harvest data relating to the 1985-86 hunting seasons. Results of annual inventory and harvest surveys and long-term trends of indices derived by each method are included. Data obtained in 1985 are compared to 1984 and long-term averages.

Objectives: To conduct annual inventories and determine the population trend and annual harvest of upland game.

Procedures: Annual inventory procedures for ring-necked pheasants included winter sex ratio counts and summer roadside counts. The winter sex ratio counts were conducted from December 15, 1984 through February 10, 1985, as snow cover conditions allowed. Indices derived include hen-cock ratios and pheasants observed per 100 hours. Annual summer roadside counts (three or more per route) were conducted from July 23-August 18 on permanently established routes. Indices derived include pheasants per mile, young per mile, young per hen, mean brood and percent of hens with young.

Mourning dove breeding population trend was determined via the annual call count survey. This survey is part of a nationwide survey administered by the U. S. Fish and Wildlife Service. Call counts are conducted over 15 permanent, 20-mile routes. One count was made on each route between May 20-30.

Random brood counts were conducted on chukar and Hungarian partridge, forest grouse (ruffed and blue), sage grouse, sharp-tailed grouse, wild turkey and quail from June 15-August 26. Indices derived for each species include mean brood size, young per 100 adults and birds observed per 100 hours of effort.

Sage grouse strutting ground counts and sharp-tailed grouse dancing ground counts were conducted from March 15-May 15. Total cocks counted, average cocks per ground and percent change from 1984 for comparable grounds were determined on a county basis.

The Gambel's quail call count route in Washington County was discontinued in 1980. Long period waterhole counts were completed in July and August.

Cottontail rabbit roadside counts were conducted over pre-established routes between July 15 and August 5. Indices derived include rabbits per mile and young per 100 adults.

Harvest questionnaires were used to determine the harvest of upland game birds, cottontail rabbit, snowshoe hare, and wild turkey. An 8.6 percent sample of eligible licensees from the current year's (1985) resident small game license file and 1985 combination license file was selected for the game bird and rabbit and hare questionnaire. Separate questionnaires were mailed to all ptarmigan and wild turkey permittees. Indices derived include total hunters, hunter-days, total harvest and hunter success per day plus success for each season.

The upland game questionnaires were analyzed by the Division of Wildlife Resources information systems services subsection. Due to accumulated rounding errors associated with transferring data from the printout, some totals (columns and percentages) may not total exactly.

Beginning in 1978, the program was expanded to report total estimated hunter-days and harvest by species and county rather than just the percent of pressure and harvest. Wild turkey and ptarmigan questionnaires were analyzed separated by Game Management personnel.

Field bag checks of upland game hunters were made primarily at checking stations, with additional random field checks made during each hunting season. Indices derived include bag per hunter (per day), bag per 100 hours, average hours per hunter-day and average hours per bird bagged. Additional sex and age composition data were compiled for some species using wing samples collected at checking stations.

In 1985 a computerized pull apart mailer was again used to obtain harvest data. Data input and storage was entered on tape. This method was initiated in 1981.

Recommendations: This project should be continued for the purpose of determining trends of upland game populations and harvest statistics in Utah.

INTRODUCTION

The objective of Utah's upland game management program is to provide recreational hunting opportunity for sportsmen within the limits of the annual harvestable surplus for each species. It is based on the knowledge that populations of upland game experience relatively high rates of annual turnover. High reproductive rates are naturally compensated for by high death rates, whether hunting is allowed or not. Annual surveys are conducted to measure the production, trend and harvest of each upland game population hunted.

This is the fifteenth edition of this annual Upland Game Report. It is an annual performance report of information compiled during inventory and harvest surveys conducted under Federal Aid Project W-65-R, Job A-4. Information contained herein was compiled by conservation officers, biologists, game managers and the upland game management staff of the Division of Wildlife Resources.

This report serves as a handbook of inventory and harvest data. It is designed primarily for the use of those concerned with the management of upland game in Utah. A separate section is devoted to each species of upland game hunted in Utah. Data are presented primarily in tabular form with limited narrative comment. The first page of each section provides a brief summary of population status and trend as indicated by inventory and harvest data.

During 1985, a total of 81,119 Utah sportsmen spent 469,106 days afield in pursuit of various upland game species (Table 1). The harvest of upland game totaled 500,985 animals. The proportion of the total upland game hunters which pursued each species is shown in Appendix Table 3 and the percentage failing to bag at least one bird of each species in Appendix Table 4. The regulations for 1985 upland game hunting seasons are shown in Appendix Table 6.

Table 1. Summary of harvest statistics from the mail questionnaire for 1985.

Species	Hunters Afield	Total Harvest	Hunter Days	Bag per Hunter-day	Bag/Hunter For Season
Pheasant	69,889	146,807	233,328	0.63	2.10
Mourning dove	28,183	256,045	96,507	2.65	9.09
Chukar partridge	7,930	20,938	24,346	0.86	2.64
Sage grouse	7,586	11,466	14,702	0.78	1.51
Forest grouse	12,646	23,097	31,290	0.74	1.83
Quail	3,065	7,051	7,994	0.88	2.30
Hungarian partridge	1,157	707	2,314	0.31	0.61
Wild turkey					
spring	270	41	747	0.96	0.15
fall	--	--	--	--	--
Band-tailed pigeon	--	--	--	--	--
Sharp-tailed grouse	0	0	0	--	--
Ptarmigan	10	7	13	0.54	0.70
Cottontail	14,059	31,397	48,371	0.65	2.23
Snowshoe	3,365	3,429	9,494	0.36	1.02
TOTAL	--	500,985	469,106	--	--

Total hunters afield for all species of upland game = 81,119

HARVEST QUESTIONNAIRE

- Harvest statistics were obtained from a random sample of licensed hunters by their response to a hunter questionnaire. The combined upland game bird and rabbit-hare questionnaire was again used.

A total of 10,772 upland game bird questionnaires, a 8.6 percent sample, were mailed. Of the total, 648 (6.0%) questionnaires were undeliverable. Of the 10,124 questionnaires delivered, 5,843 (57.7%) usable upland game questionnaires were returned. Of those, 2,058 purchased a license but did not hunt upland game. By dividing the total of 125,226 eligible licensees by the usable returns (5,843), a projection factor of 21.431798 is derived.

The 1985 hunter questionnaire sample size decreased slightly from 1984, however, a followup questionnaire was sent to those who failed to return the first one. This resulted in a 54 percent overall rate of return for usable questionnaires. A high rate of return is desirable in order to obtain an adequate sample of harvest estimates in counties where hunting pressure and harvest are limited. Extremely small samples from these counties tend to over-estimate the harvest and thus bias the results. Although harvest, number of hunters and days-afield may be over-estimated where small samples are obtained, harvest per hunter-day should be relatively precise.

The upland game questionnaire is designed to monitor statewide harvest trend from year to year. The more extensively a species is hunted, the more accurately the questionnaire measures the trend data. In an effort to improve the accuracy of indices for species which receive very little hunting pressure and harvest, and which have low densities and limited distribution, a unique questionnaire for that species is mailed to the permit holder. This method has been used for wild turkey, band-tailed pigeon, sharp-tailed grouse and white-tailed ptarmigan.

The annual harvest report is sometimes criticized for being inaccurate and without value. However, report users must recognize that the accuracy of the questionnaire is based on some basic assumptions. These assumptions are: (1) the returned useable sample is completely random (2) respondents recorded data correctly, i.e., they clearly understood the questionnaire, (3) respondents recorded data accurately, did not guess and were truthful, and (4) respondents correctly identified species hunted. If these assumptions are not met, projections of harvest by county may be over-estimated due to nonrespondent or memory biases. Extreme caution should be used in the interpretation of estimated harvest and hunters for specific species in specific counties. Rather, the long term trend in these indices should be used in managing the populations.

Presently, the upland game annual report contains the best data available and therefore constitutes the basic facts of upland game management. Although this report has its limitations, the trend data is valuable in making professional judgements regarding upland game populations and harvest.

The annual report is used in wildlife planning. It can be used to establish relative importance among species and for developing new resources through transplants or habitat developments. It points out areas of needed research by indicating problems and possible causes. It documents population trends and it combines all this inventory information into one easily accessible publication. Thus it is used extensively by federal land management agencies in environmental impact statements and management plans. It will become increasingly more important in developing management plans, and assessing impacts on wildlife habitat.

WEATHER CONDITIONS

Weather information used in this report is from the office of the Utah State Climatologist and N.O.A.A. Climatological Data Periodical. (Appendix Table 1, 2 and Figures 1 and 2.)

The 1984-85 winter weather was cold. Annual precipitation in 1985 was above normal statewide, except for the Dixie division. Above normal precipitation fell in November and December 1984. By the end of December, state average precipitation was 142 percent of normal. In the Northcentral Division, most precipitation accumulated as snow.

Temperatures dropped considerably below normal in January. Mean temperatures averaged 5° F below normal in January and February. In the Northcentral Division, mean temperatures in January and February were 6.9° F and 10.2° F below normal, respectively. Mean temperatures in the Uinta Basin were significantly below normal for both months. This weather can have devastating effects on introduced exotic small game such as pheasants, California quail, chukar and Hungarian partridge, if food is not available. Cottontails have also been severely impacted by cold winters since 1983.

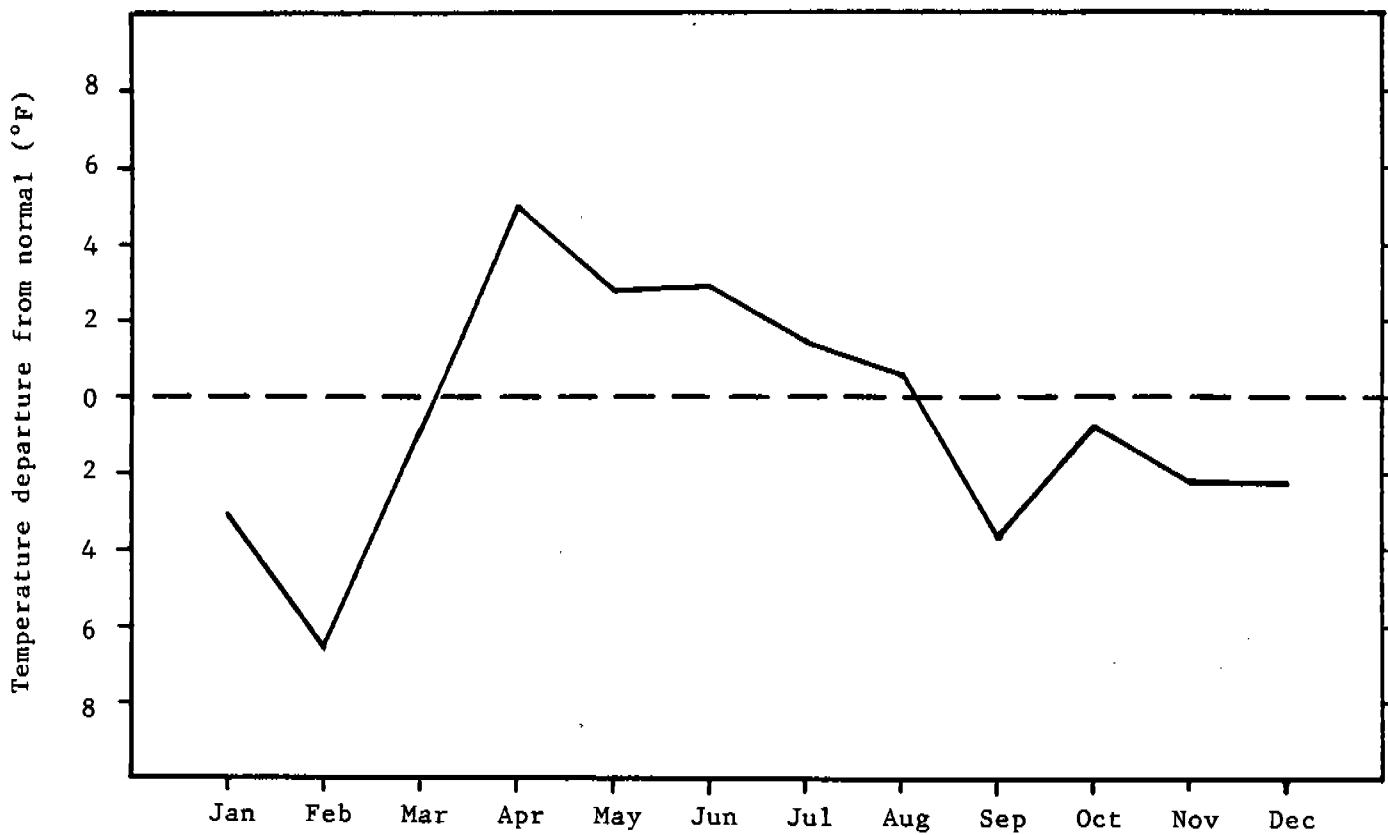

Figure 1. Monthly average temperature departure from normal, 1985

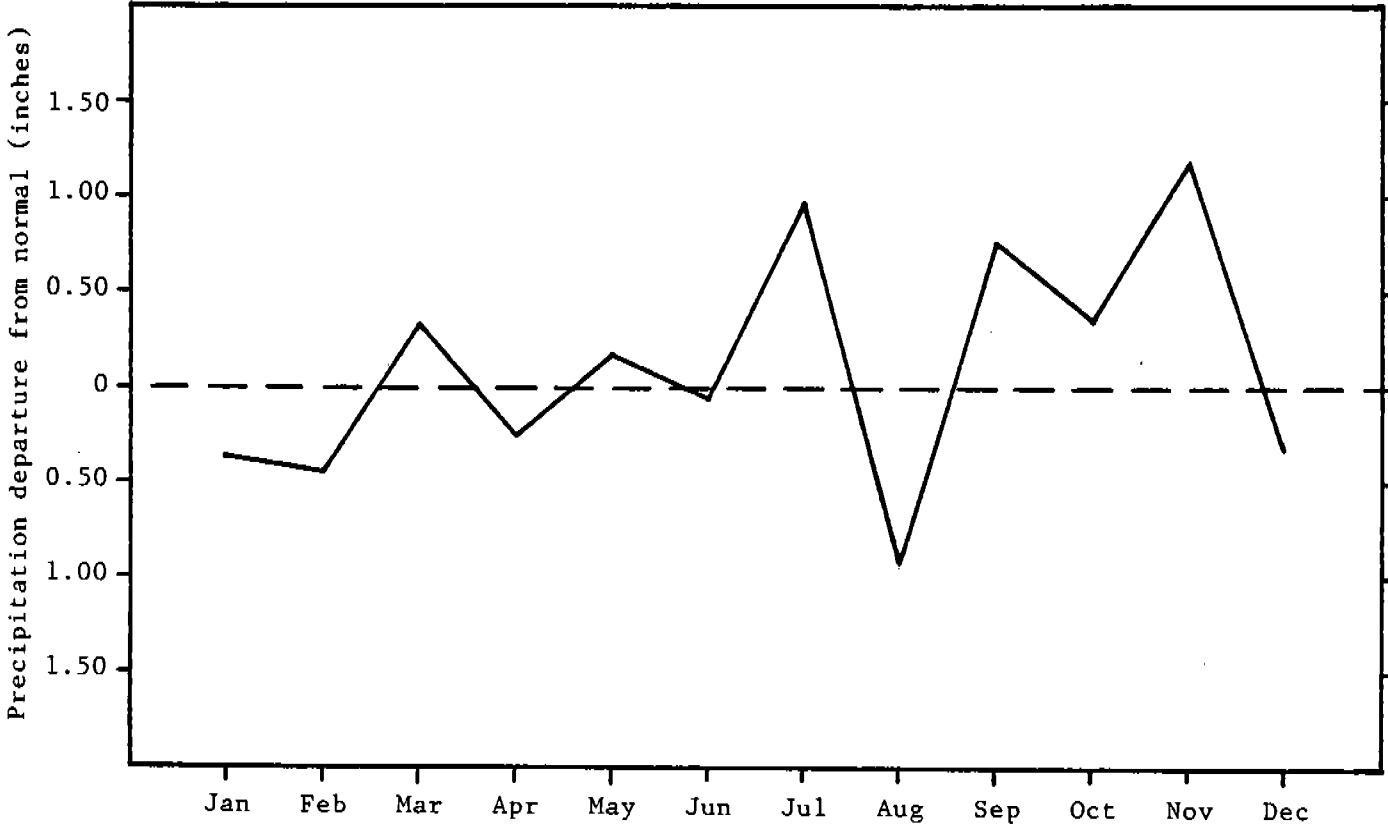

Figure 2. Monthly average precipitation departure from normal, 1985

April, May June and July were warmer and drier than normal, resulting in improved hatching success and brood survival. July was much more wet than normal resulting in good cover conditions. The accumulated precipitation averaged 130 percent of normal for each of these months.

LICENSE SALES

Small game license sales by type and cost are listed in Table 2. The number of licenses sold for all types decreased slightly in 1985. Likewise, the proportion of Utah's population hunting small game is declining (Table 3). In the early 1970's about 10 percent of Utah's population was hunting small game. By 2000, we project that only 5 percent will be hunting small game.

Table 4 identifies revenue generated to Utah Division of Wildlife Resources from small game license sales. Small game program budgets run about half the revenue generated, with the other half going to support services such as law enforcement, administration, accounting, and field service.

Table 2. Statewide small game license sales information, 1954-85.

¹Value does not include cougar, bear, turkey permits and commercial hunting area licenses.

²Combination license values are based on the assumption that all waterfowl hunters purchased only combination licenses. They may fish and hunt big game but they do not hunt any other small game. Therefore, duck stamp sales are subtracted from combination license sale when projecting revenue generated. The proportion of the combination license fee attributed to small game equals the resident small game license fee divided by the resident fishing license fee plus the resident big game license fee plus the resident small game license fee.

³Total federal duck stamps sold does not include those sold during the second quarter, April-June, because persons purchasing stamps during this quarter tend not to be hunters.

⁴Half of the juvenile small game license sales were attributed to waterfowl hunters. Federal Duck Stamps are not required of juveniles less than 16 years of age.

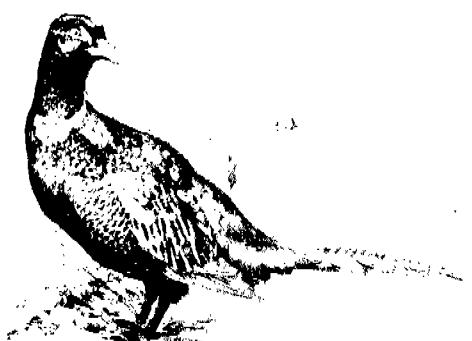

RING-NECKED PHEASANT

SUMMARY

The 1985 statewide breeding population, based on 1984 harvest data, declined about 13 percent from the 1984 breeding population. The effect of the 1983-84 winter is still being reflected by pheasant populations in northern Utah. Winter sex ratio indices may be biased by the fact that effort was not consistent when counting conditions were good. Flocks are often concentrated near roads where they are easily counted. Winter carry-over from 1984 was fair in northern and central Utah.

Weather conditions during the nesting season were very good in 1985. Statewide monthly average temperatures were above normal. Accumulated precipitation was also above normal. Although, fewer broods were observed, average brood size generally increased, nevertheless, overall production was down due to reduced breeding populations.

Harvest statistics compiled from the questionnaire indicated less success compared to 1984. Hunter pressure remained slightly above average but total harvest decreased 24 percent. Birds per hunter-day decreased 15 percent from 1984. Field bag check data also showed that hunter success declined during 1985.

Winter Sex Ratio Counts

Results of the survey for the winter of 1984-85 and long-term trends are shown in Tables 1 and 2 of this section. Statewide comparisons to the winter of 1983-84 and the 10-year average are as follows:

	<u>Winter of 1984-85</u>	<u>Percent change from 1983-84</u>	<u>Average</u>
Total pheasants counted (roadside)	2,153	-21	-63
Hens per cock	3.8	+46	0
Pheasants observed per 100 hours	1,116	-47	-24
Total hours effort (roadside)	193	+48	-60

Winter sex ratio counts indicated a 47 percent decline in pheasants observed. However, decreased effort in central and southern regions may reflect a biased decline in the breeding population. Density estimates can be biased due to the non-random nature of the survey technique if effort is minimal. The hen-cock ratio increased 46 percent from 1984 and was equal to the long term average. Counting conditions were generally good, but decreased effort reduced pheasant observations. No effort was expended in the Central Region, even though it accounts for one-third of the state's hunting pressure and harvest. More pheasants are harvested in Utah County than in any other county in the state.

Roadside Counts

A summary of summer roadside pheasant counts for 1985 is shown in Table 3. Long-term trends of pheasants per mile, young per mile, young per hen, percent of hens with young and mean brood size are found in Tables 4-8. Summer 1985 survey results compared to 1984 and the previous 10-year average follow:

	<u>1985</u>	<u>Percent change from 1984</u>	<u>Average</u>
Total pheasants observed	1,629	-9	-38
Total miles driven	2,008	+5	-36
Pheasants per mile	0.81	-14	-20
Average brood size	6.71	+40	+30
Young per hen	5.04	+29	+37
Percent of hens with young	62	-17	-14

April, May, June and July temperatures were above normal. In the North Central, South Central, Uinta Basin and Southeast climatic subdivisions (major pheasant distribution), an average of 0.30 inches above normal precipitation fell in each climatic subdivision through the year. April and June were warmer and drier than normal. May was hotter and wetter than normal with July much wetter than normal. Hatching success should have been enhanced by warm, dry weather in April. Also, warm, dry weather in June should have increased brood survival. Counting conditions were affected by dense vegetation in many areas.

Pheasant production appears to have increased from 1984 in all regions except the Northeastern and the Southeastern. In the Northern Region, young broods were observed in the late summer indicating unsuccessful early nesting attempts. The density index (pheasants per mile) decreased from 0.94 in 1984 to 0.81 in 1985 which is below the 10-year average (1.01).

Record high levels of the Great Salt Lake and Utah Lake reduced both the quantity and quality of nesting and brood rearing habitat in Box Elder, Salt Lake, Davis, Weber and Utah counties.

Harvest

Hunter Questionnaire

Results of the hunter questionnaire for 1985 are shown in Table 9. Long-term trends of pheasants bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 10-12 and total statewide harvest statistics in Table 13. A comparison of 1985 harvest statistics to 1984 and the 37-year average follow:

	<u>1985</u>	<u>Percent change from 1984</u>	<u>Average</u>
Pheasant hunters	69,889	-9	-16
Pheasants harvested	146,807	-24	-37
Hunter-days afield	233,328	-10	+5
Pheasants per hunter-day	0.63	-15	-39
Pheasants per hunter	2.10	-16	-25

In northern Utah, hunters were told to expect fair hunting with success comparable to 1984. Low breeding populations were noted but production was fair for those birds which made it through the winter. Fair to poor success was predicted in central, northeastern and southern Utah. Success was expected to be good in southeastern Utah.

Total hunters decreased 9 percent from 1984 and remained below the long-term (1948-84) average. Hunter-days afield and total harvest also decreased 10 and 24 percent, respectively, from 1984. Hunter success (pheasants per hunter-day) also decreased 15 percent from 1984, and 39 percent below average. Pheasants per hunter also decreased 16 percent.

Long-term trends (1970-85) of total hunters, hunter-days, harvest and hunter success are shown in Figure 1. Generally, the trend continues toward more hunter-days with gradual declines in total pheasants harvested and hunter success.

Field Bag Checks

A summary of pheasant field bag check data for 1985 is shown in Table 14. The hunter success trend determined via bag checks since 1980 is found in Table 15. A comparison of 1985 data, on a statewide basis, to 1984 and the 10-year average follow:

	<u>1985</u>	<u>Percent change from</u>	
		<u>1984</u>	<u>Average</u>
Total hunters checked	3,474	+10	-27
Total hours hunted	9,825	+19	-37
Pheasants per hunter (complete hunts)	0.44	-24	-45
Pheasants bagged per 100 hours	13	-32	-28
Average hours per hunter-day (complete hunts)	3.3	+6	-21
Hours hunted per pheasant bagged (complete)	7.7	+45	+40

Checking Station Report

Weather was generally fair over the state Saturday and Sunday (November 2-3, 1985). Sunny and fair weather prevailed over northern Utah on Saturday, and temperatures were in the 60's.

Generally, hunting pressure was down substantially over the state. This is attributed to decreasing pheasant populations and to less land being accessible to hunters, particularly in Weber, Davis, Salt Lake, Utah and Millard counties. Hunter success was also down from 1984 statewide.

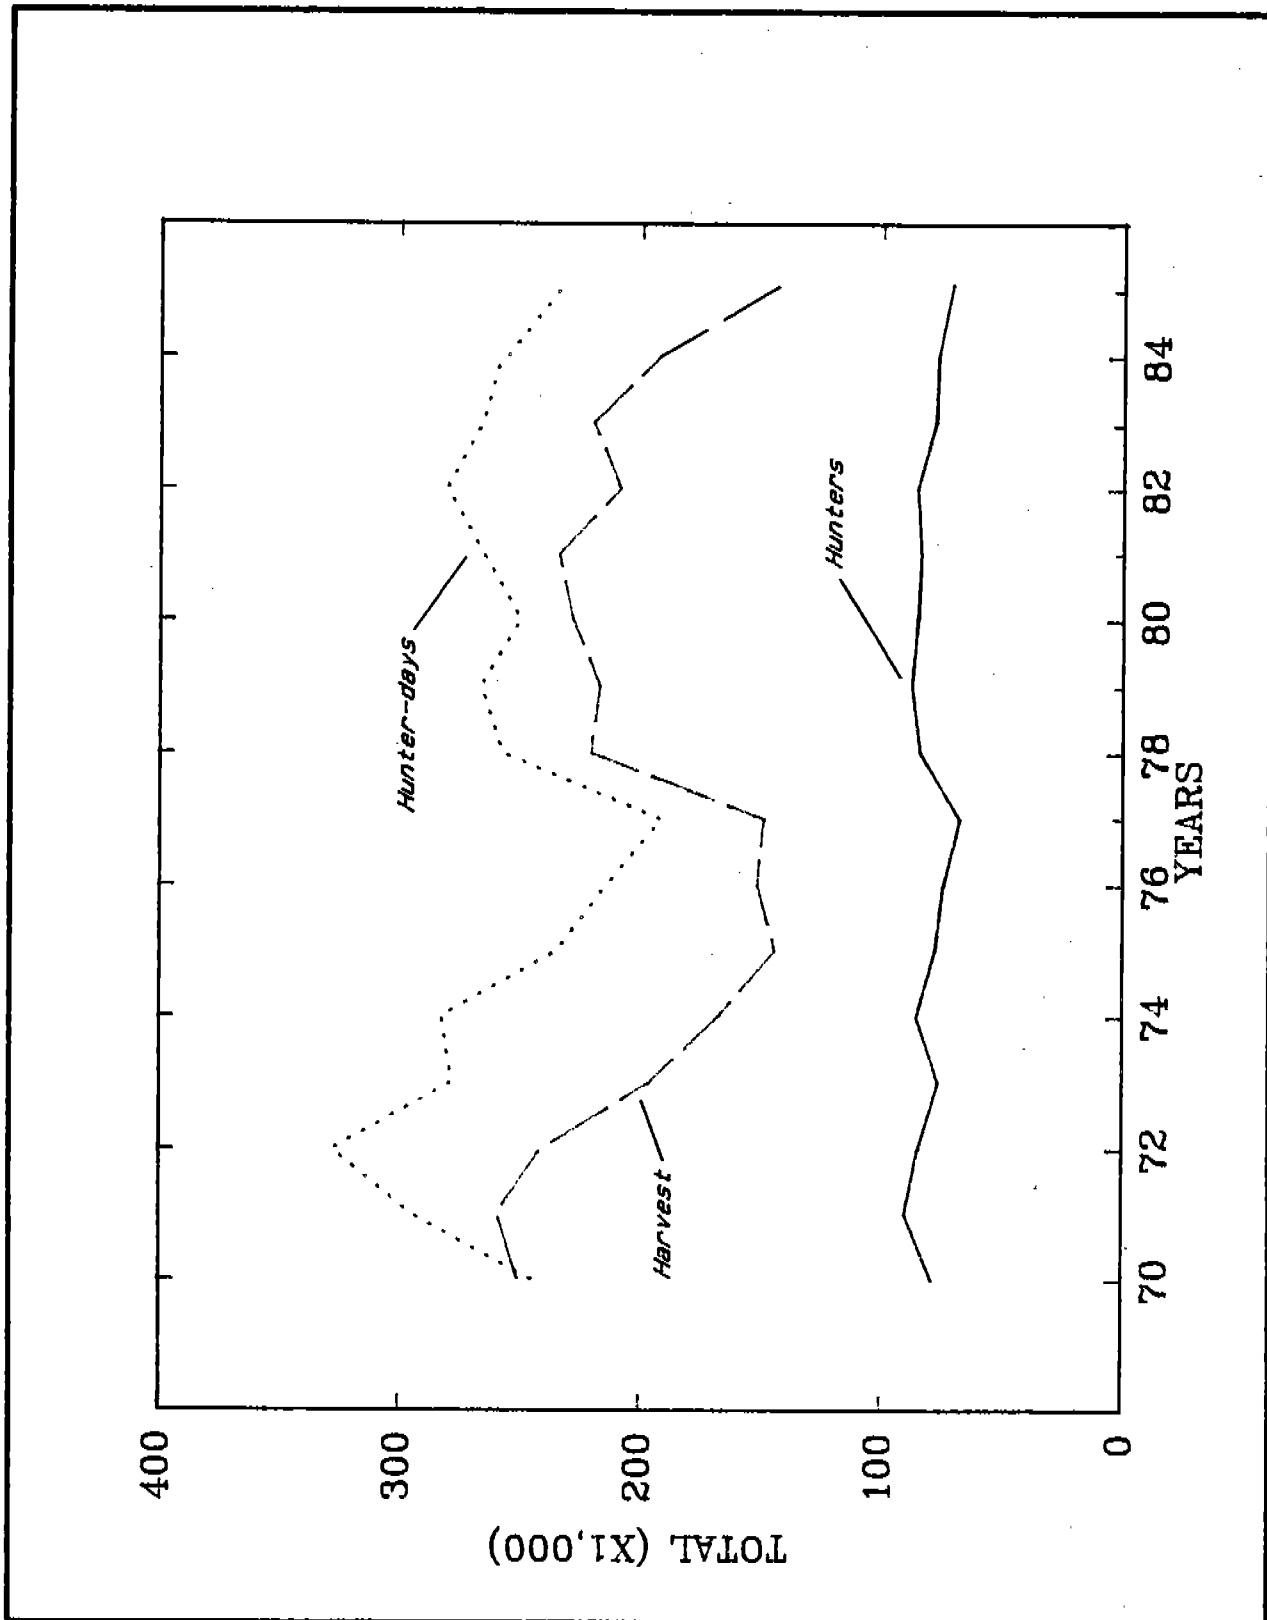

Figure 1. Statewide trend of pheasant harvest statistics.

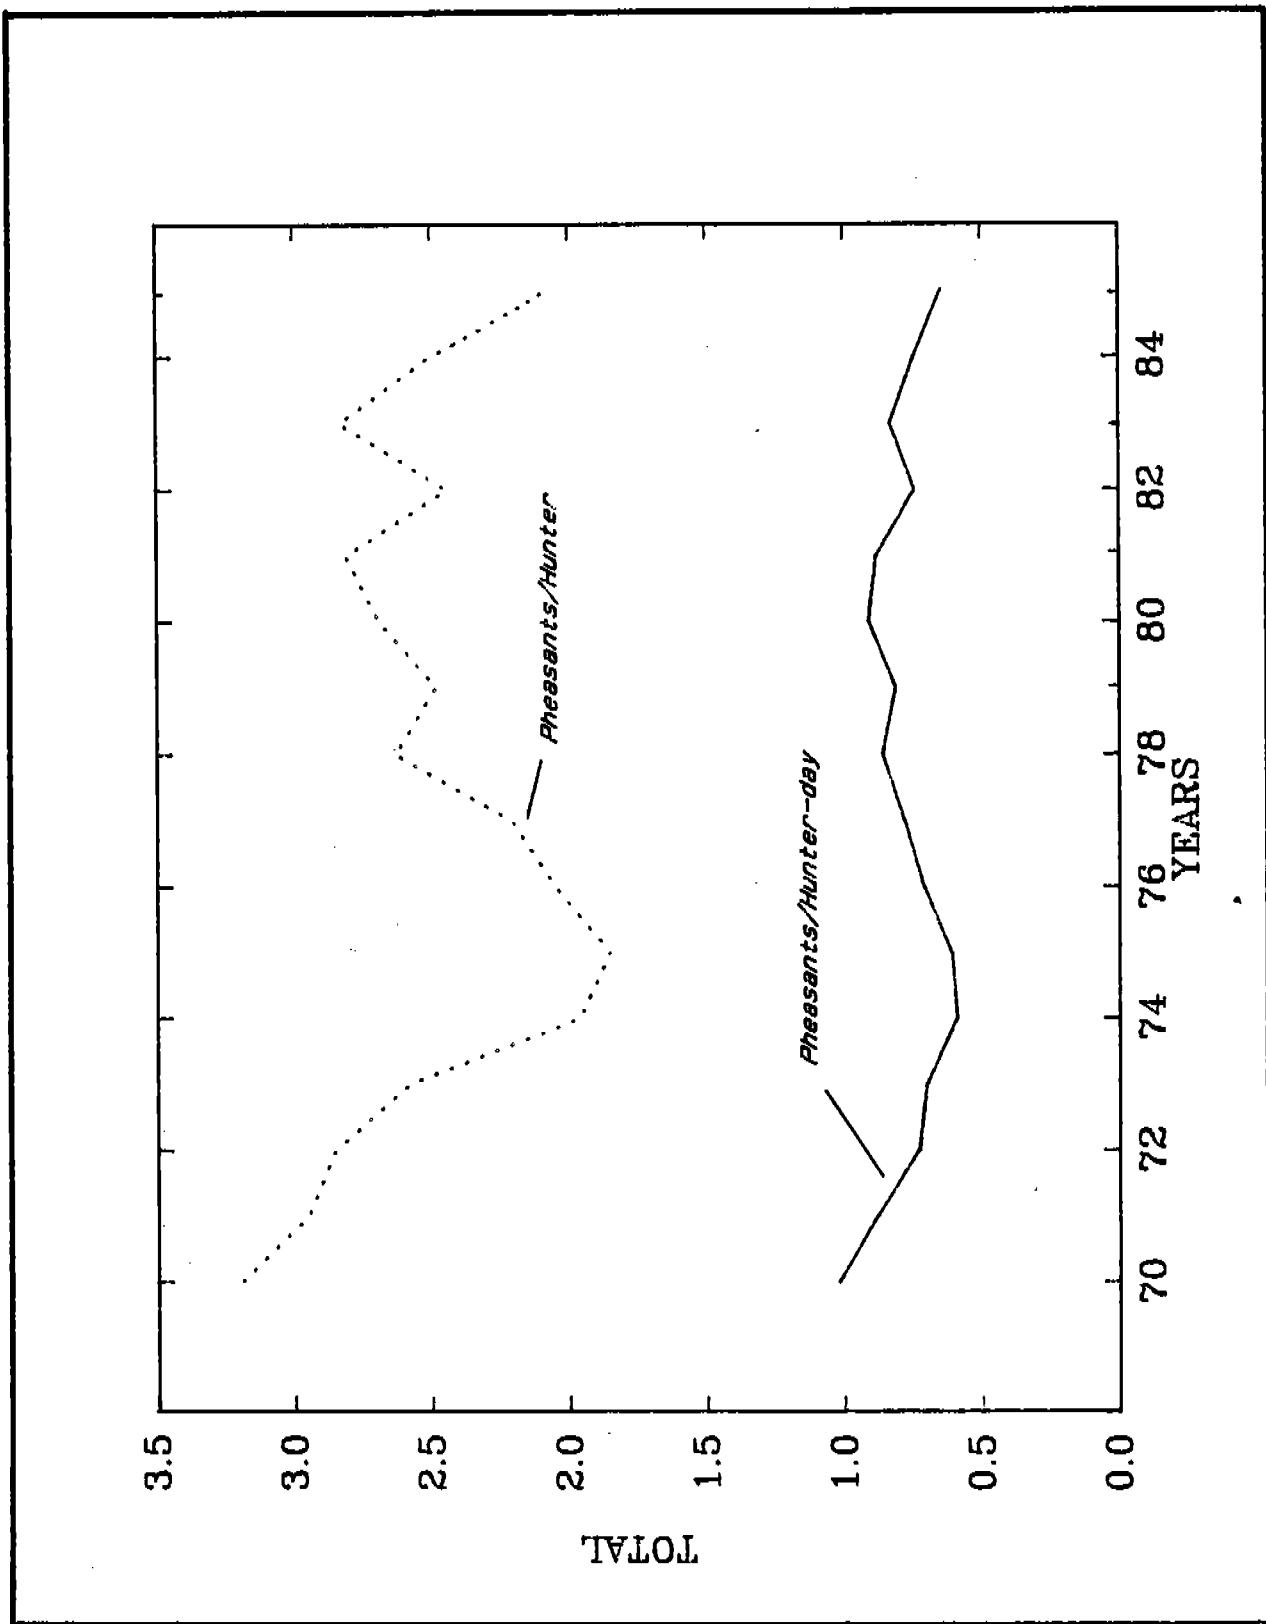

Figure 2. Statewide trend of pheasant harvest statistics.

MIGRATORY UPLAND GAME BIRDS

SUMMARY

Mourning Doves

D
O
V
E
S
&
P
I
G
E
O
N
S

The breeding density index decreased significantly in 1985 and remained below average.

Harvest statistics derived from the questionnaire showed decreased hunter pressure and harvest compared to 1984. However, hunter success increased 2 percent.

Field bag checks also indicated a decrease in harvest but slight increase in hunter success supporting the results of the questionnaire survey.

Division personnel collected 3,512 wings for aging during 1985. Aging of wings indicated juvenile per 100 adult ratio decreased to 114 compared to 131 in 1984, and the 18-year average of 115. Significantly, more harvested juvenile birds were hatched earlier than in 1984, but about equal to the long-term average.

Band-tailed Pigeons

No band-tailed pigeons were banded in Utah in 1985. Banding of band-tailed pigeons was discontinued in 1979, as a result of recommendations by the Four-Corners Band-tailed Pigeon Study Committee.

Hunter participation and harvest during the 1985 season is unknown because data was unavailable.

MOURNING DOVE

Call Count Survey

Results of the 1985 call count survey are found in Table 1 of this section. The long-term trend of the state's breeding density index (average doves heard per route) is shown in Table 2. Indices shown in each of these tables are unweighted and consequently differ from those published in the annual Mourning Dove Status Report compiled by the Fish and Wildlife Service; however, indicated trends are similar (Figure 1). The following is a comparison of the results of the 1985 survey to 1984 and the average for the period 1964-1984:

		<u>Percent change from</u>	
	<u>1985</u>	<u>1984</u>	<u>Average</u>
Average doves heard per route	8.0	-38	-41
Average calls heard per route	32.2	-45	-44
Average doves seen per route	10.5	-51	-29

Coo count data indicated decreased breeding activity in late May compared to 1984 and dropped to 41 percent below the long-term average.

Harvest

Hunter Questionnaire

Information obtained from the hunter questionnaire for 1985 is summarized in Table 3. Long-term trends of mourning doves bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 4-6 and total statewide harvest statistics in Table 7. The following is a comparison of the harvest statistics for 1985 compared to 1984 and the 10-year (1975-84) average:

		<u>Percent change from</u>	
	<u>1985</u>	<u>1984</u>	<u>Average</u>
Mourning dove hunters	28,183	-8	-12
Mourning dove harvest	256,045	-9	-20
Hunter-days afield	96,507	-11	-11
Mourning doves per hunter-day	2.65	+2	-10
Mourning doves hunter	9.09	-2	-9

The Division predicted one week before the season 30,000 hunters and 275,000 harvest. A significant decrease in dove hunter success was predicted due to a 38 percent decline in spring dove call count index. However, hunter success increased two percent, although total harvest decreased slightly compared to 1984. Numbers of dove hunters, hunter-days afield and doves per hunter-day remained below the 10 year average.

Long-term harvest trends are depicted in Figure 2.

Accumulated annual precipitation was well above normal by September 1. Recurring thunderstorms produced excellent forage and cover conditions for doves.

Field Bag Checks

A summary of field bag check data for 1985 is shown in Table 8. Hunter success trends determined via this method are shown in Table 9. Results of the 1985 survey compared to 1984 and the average (1967-84) follow:

	<u>1985</u>	<u>Percent change from 1984</u>	<u>Average</u>
Total hunters checked	1,792	+2	-1
Total hours hunted	6,078	-26	-5
Doves per hunter (complete hunts)	3.42	-10	-7
Doves bagged per 100 hours	95	+19	+2
Average hours per hunter-day (complete hunts)	3.9	-9	+3
Hours hunted per dove bagged	1.1	-15	0

September 2, 1985 was the Labor Day holiday so more hunters had an excellent opportunity to hunt. However, rain and scattered showers were common statewide on the opening day and affected the hunting. Field bag checks indicated a decrease in hunter success. This confirms the questionnaire results which also indicated a slight increase in hunter success. The total number of hunters checked was up 2 percent from 1984. Dove hunters spent less time afield per hunter-day than in 1984, and less time was spent per dove bagged, according to field bag check data.

Age Composition of the Harvest

A summary of the age composition of harvested mourning doves from 1976 through 1985 is contained in Table 10. Hatching dates for immature doves harvested in the Northern Region since 1976 are shown in Table 11. Hatching dates for immature doves harvested in Utah in 1985 are shown in Table 12.

Following is a comparison of data collected in 1985 to 1984 and long-term averages (1966-84):

	<u>1985</u>	<u>Percent change from 1984</u>	<u>Average</u>
Sample size	3,512	-10	+6
Immatures/100 adults	114	-13	-1
Percent of immatures hatched on: (N. Region)			
August 3 or later	38.7	-10	+1
July 25 or later	80.7	-12	0
Before July 25	19.3	+127	-1

Fewer wings were collected for aging during the 1985 season compared to 1984. The 114 immatures per 100 adults indicated an average hatch compared to the previous 19-year average. Wing analysis indicated significantly earlier hatching for 1985 compared with 1984 but about normal for the long-term average.

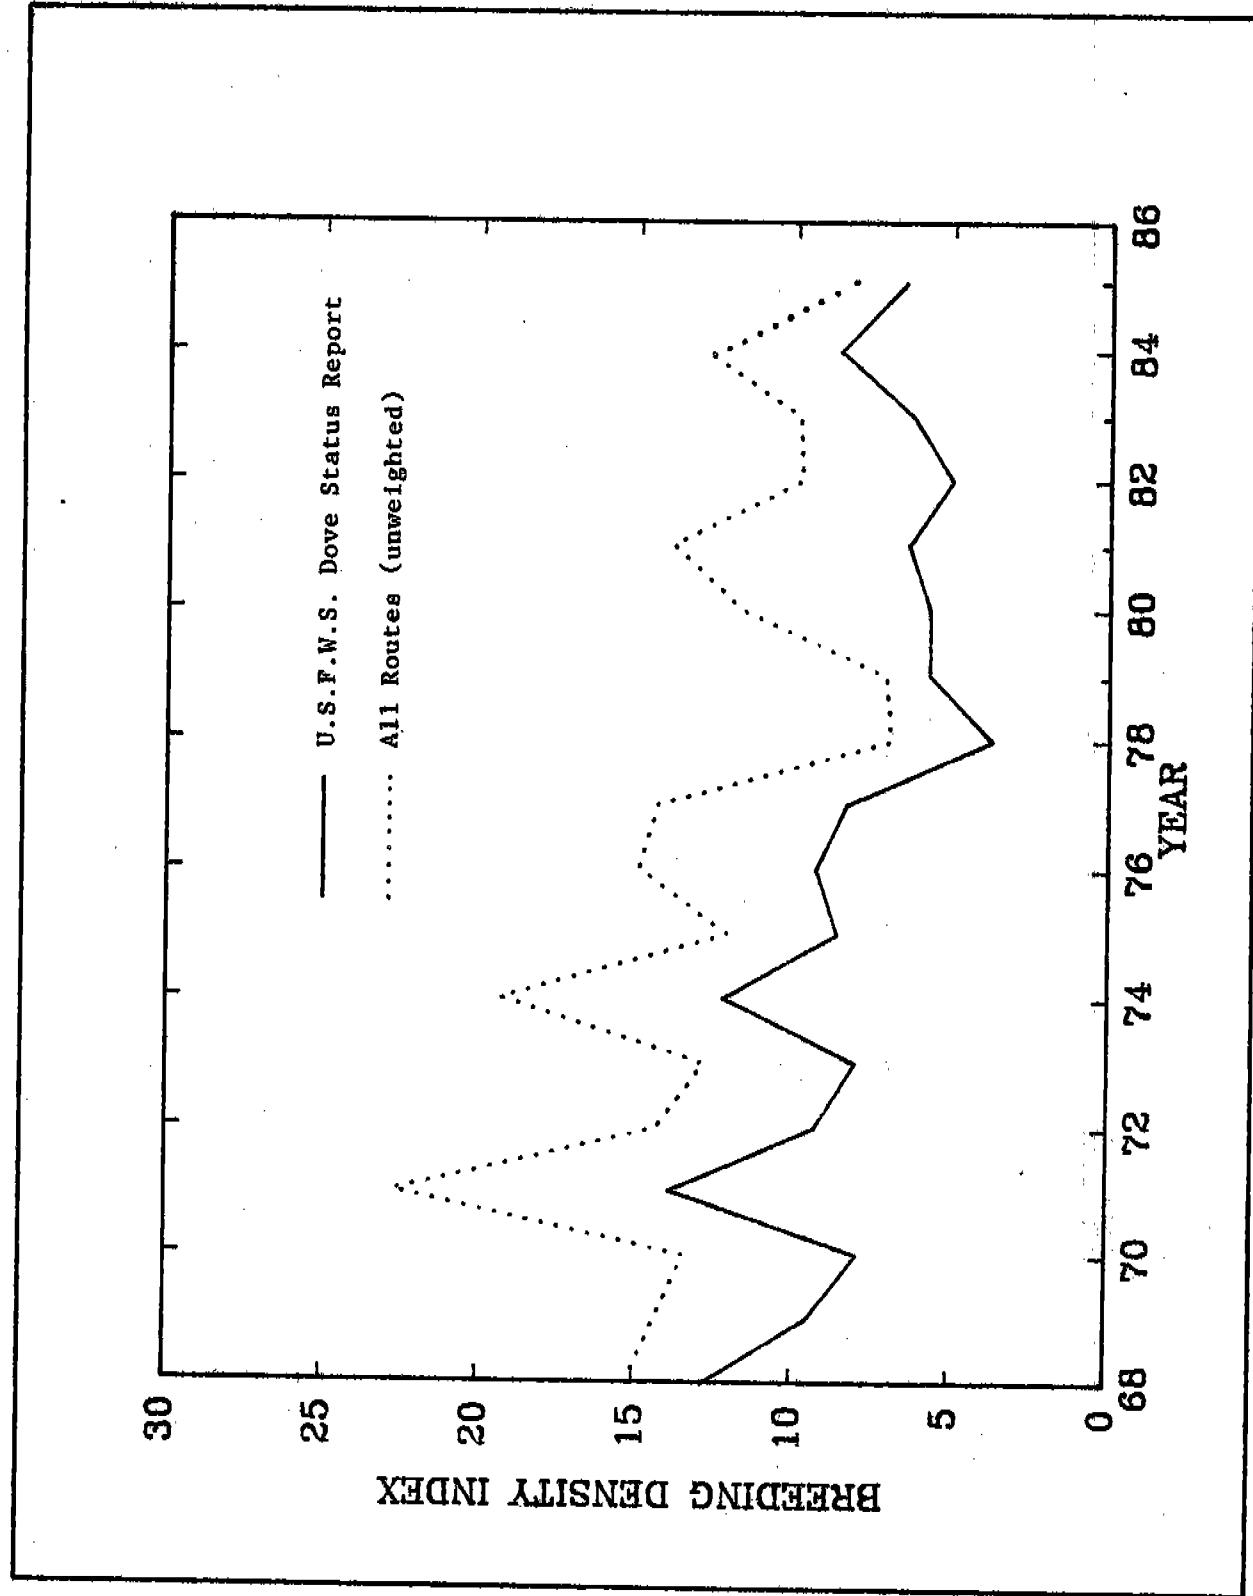

Figure 1. Mourning dove breeding density index trend.

BAND-TAILED PIGEON

Banding

Between 1969 and 1978, 2,649 total pigeons were banded in Utah and 975 recaptured. Results of banding efforts through 1972 indicated a direct recovery rate of 1.4 percent. If expanded, using an assumed 30 percent band reporting rate, an estimated harvest rate of less than 5 percent of the state's pigeon population is indicated. Addition of an estimated 16 percent crippling loss would result in a total kill rate of from 5-10 percent, well within the harvestable surplus.

Harvest

Results of the 1985 band-tailed pigeon harvest are unknown, because no hunter reports were received. Permits were not required, therefore, a questionnaire was not sent to participants. Harvest trends since 1970 are shown in Table 14.

	<u>Percent change from</u>

CHUKAR PARTRIDGE

SUMMARY

The statewide breeding population of chukars decreased in 1985 following another severe winter in northwestern Utah. Late winter and early spring precipitation, critical to successful chukar production, was below average. Below normal cold temperatures in January and February also resulted in an extended period of snow cover limiting exposed winter feed for chukars.

Results of the brood survey indicated that brood production was above average, although breeding populations were down. Favorable nesting conditions and adequate forage were available as a result of accumulated precipitation during November and December. The indicated chukar density increased significantly during 1985, but chukars observed per 100 hours of effort were still 24 percent below average.

Harvest statistics reflected a slight increase in harvest. Likewise, hunter success (chukars per hunter-day) increased 30 percent from 1984. Chukar hunters decreased 19 percent and spent 21 percent less time afield than in 1984. Apparently, good reproduction helped compensate for the winter losses and decreased breeding populations.

Brood Counts

Results of the annual random brood survey for 1985 are shown in Table 1 of this section. Long-term trends of young-adult ratios, mean brood size and chukars observed per 100 hours are found in Tables 2-4. Following are the survey results for 1985 compared to 1984 and the 10-year (1975-84) average:

	<u>1985</u>	<u>Percent change from 1984</u>	<u>Average</u>
Total chukars observed	385	+70	-57
Young per 100 adults	670	+57	+101
Mean brood size	8.46	+22	+4
Chukars observed per 100 hours	286	+63	-24
Total hours effort	134.5	+5	-36

Harvest data for 1984 indicated breeding populations for 1985 were significantly below statewide average. In addition, adverse winter weather continued to stress the breeding populations for the second consecutive year in northern Utah. Late winter and early spring precipitation (January-April) was below average over the entire state (Figure 2). However, below normal temperatures in January and February were extremely harsh with Utah chukar populations. Significant above average temperatures were recorded in April, May and June. Above normal precipitation occurred in July during the brood rearing period.

Effort on chukar brood counts increased slightly from 1984 but remained far below average.

Brood count sample sizes were again extremely small for all regions. The Central Region counted 8 and the Southeastern Region counted 3 of the state total of 13 broods. Chukar density was 24 percent below the 10-year average but production was up considerably from 1984.

Harvest

Hunter Questionnaire

Results of the hunter questionnaire survey for 1985 are shown in Table 5. Long-term trends of chukars bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 6-8 and total statewide harvest statistics in Table 9. Following is a comparison of 1985 harvest statistics to 1984 and the 27-year average:

	<u>1985</u>	<u>Percent change from 1984</u>	<u>Average</u>
Chukar hunters	7,930	-19	-47
Chukars harvested	20,938	+4	-51
Hunter-days afield	24,346	-21	-42
Chukars per hunter-day	0.86	+30	-9
Chukars per hunter	2.64	+29	-4

Chukar hunters spent 21 percent less time afield but harvested about 4 percent more birds than in 1984. Chukars per hunter-day was above the 1984 level but still 9 percent below the statewide average. The Central Region again had the highest percentage of the harvest (69%) in 1985, and also had the highest percentage of hunter pressure (56%).

Field Bag Check

A summary of field bag check data for 1985 is shown in Table 10. The hunter success trend determined by field bag checks since 1980 is shown in Table 11. Data for the 1985 season compared to 1984 and the (1966-84) average follow:

	<u>1985</u>	<u>Percent change from 1984</u>	<u>Average</u>
Total hunters checked	580	+544	+17
Total hours hunted	3,342	+1,033	+52
Chukars per hunter (complete hunts)	0.12	-14	-88
Chukars bagged per 100 hours	3	-25	-87
Average hours per hunter-day (complete hunts)	6.0	+50	+33
Hours hunted per chukar bagged (complete hunts)	50.1	+76	+708

Field bag checks indicate hunter success was down 14 percent from 1984 and well below (88%) average. However, these data were significantly influenced by the large sample from the Box Elder County Checking Station where 87% of total hunters were checked. Box Elder county hunters accumulated 92% of total hunter-days afield but harvested only 4 percent of total birds. It can be assumed that many of these Box Elder County hunters were spending much of their time hunting other species particularly sage grouse. All other regions indicated improved hunter success although sample sizes were small. If Box Elder County data was not considered, then, fewer hunters pursued chukars in 1985 and spent less time afield. The hours required to bag a chukar was 48 percent less than average. When Box Elder County data is added, the time required to bag a chukar was 708 percent more than average.

SAGE GROUSE

SUMMARY

Harvest data for 1984 indicated below average breeding populations of sage grouse for 1985. Strutting ground surveys indicated a decrease in the average male grouse attendance from 1984.

Brood surveys showed increased production throughout the state. Likewise, birds observed per 100 hours increased 58 percent compared to 1984, but remained significantly below average.

The increase in production in 1985 was apparent in harvest statistics collected from questionnaires and from field bag checks. Total statewide harvest increased 5 percent but was 24 percent below the 22-year average. Sage grouse bagged per hunter and sage grouse bagged per hunter-day also increased from the previous year. Total hunters and hunter-days afield both decreased 8 and 4 percent, respectively, from 1984.

Strutting Ground Counts

The status of the sage grouse breeding population for 1985, as indicated by strutting ground counts, is shown in Table 1 of this section. Results of this survey for 1985 compared to 1984 and the 1967-84 average follow:

		<u>Percent change from</u>	
	<u>1985</u>	<u>1984</u>	<u>Average</u>
Number of grounds counted	97	+126	-8
Total male grouse counted	1,234	+86	-41
Average male grouse per ground	13	-13	-35
Percent change from previous year (comparable grounds)	-1	--	--

Access for spring 1985 strutting ground counts was generally good in all regions of the state. The numbers of grouse observed increased statewide, although the Central Region submitted no observation data. The statewide index for comparable grounds was down 1 percent from 1984. Harvest data for 1984 indicated significantly below average populations going into the winter of 1984-85, but the numbers of juvenile birds indicated increased production during 1985. Declines in breeding populations and loss of habitat continue to be the trend in most areas of the state.

Brood Counts

Results of the summer inventory survey for 1985 are found in Table 2. Long-term trends of young-adult ratios, mean brood size and sage grouse observed per 100 hours are shown in Tables 3-5. Indices for 1985 are compared to 1984 and the previous 10-year (1975-84) average as follows:

		<u>Percent change from</u>	
	<u>1985</u>	<u>1984</u>	<u>Average</u>
Total sage grouse counted	1,080	+14	-60
Young per 100 adults	147	+18	-5
Mean brood size	4.04	-5	-10
Sage grouse observed per 100 hours	284	+58	-24
Total hours effort	380	-28	-46

The effort devoted to sage grouse brood counts was 46 percent below average, and the total number of grouse counted was 60 percent below average.

Sage grouse density increased 58 percent from 1984, and production showed an 18 percent increase, however, both remained 24 and 5 percent below average, respectively. An increase in young grouse were observed, but the average brood size was 10 percent below the 10-year average.

Harvest

Hunter Questionnaire

Results of the 1985 hunter questionnaire are shown in Table 6. Long-term trends of sage grouse bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 7-9 and total statewide harvest statistics in Table 10. The results of the 1985 hunting season compared to 1984 and the 1963-84 average follow:

	<u>1985</u>	<u>Percent change from</u>	
		<u>1984</u>	<u>Average</u>
Sage grouse hunters	7,586	-8	-30
Sage grouse harvested	11,466	+5	-24
Hunter-days afield	14,702	-4	-18
Sage grouse per hunter-day	0.78	+8	-7
Sage grouse per hunter	1.51	+14	+7

Although sage grouse populations are below average, production increased slightly in 1985 and was reflected in the harvest. Total statewide harvest increased 5 percent, while total sage grouse hunters and hunter-days afield decreased. Hunter success decreased 11 percent in the Northern Region where five of the seven counties were closed to sage grouse hunting. Nevertheless, 20 percent of the harvest and 32 percent of the hunting pressure still occurred in the Northern region.

Long-term sage grouse harvest trends are shown in Figure 1.

Field Bag Checks

A summary of field bag check data for 1985 is shown in Table 11. Hunter success trends determined via this method are shown in Table 12. Results of the 1985 survey compared to 1984 and the 1975-84 average follow:

	<u>1985</u>	<u>Percent change from</u>	
		<u>1984</u>	<u>Average</u>
Total hunters checked	985	-2	-50
Total hours hunted	4,796	-19	-40
Sage grouse per hunter (complete hunts)	0.93	+15	+12
Sage grouse bagged per 100 hours	17	+31	-11
Average hours per hunter-day (complete hunts)	4.7	-20	+2
Hours hunted per grouse bagged	5.8	-22	0

Sex and Age Composition of the Harvest

A summary of the sex and age composition of harvested sage grouse in 1985 is found in Table 13 and the trend from 1982-85 in Table 14.

Following are data derived from wing surveys in 1985 compared to 1984 and the 1980-84 average:

		<u>Percent change from</u>	
	<u>1985</u>	<u>1984</u>	<u>Average</u>
Sample size	797	-3	-34
Percent males	46	+12	+12
Percent females	54	-8	-8
Young per 100 adults	192	+24	+50
Young per 100 hens (adult)	285	+12	+47

Analysis of wings collected at checking stations during the 1985 season indicates that statewide production was up compared to 1984, and above the previous 5-year average.

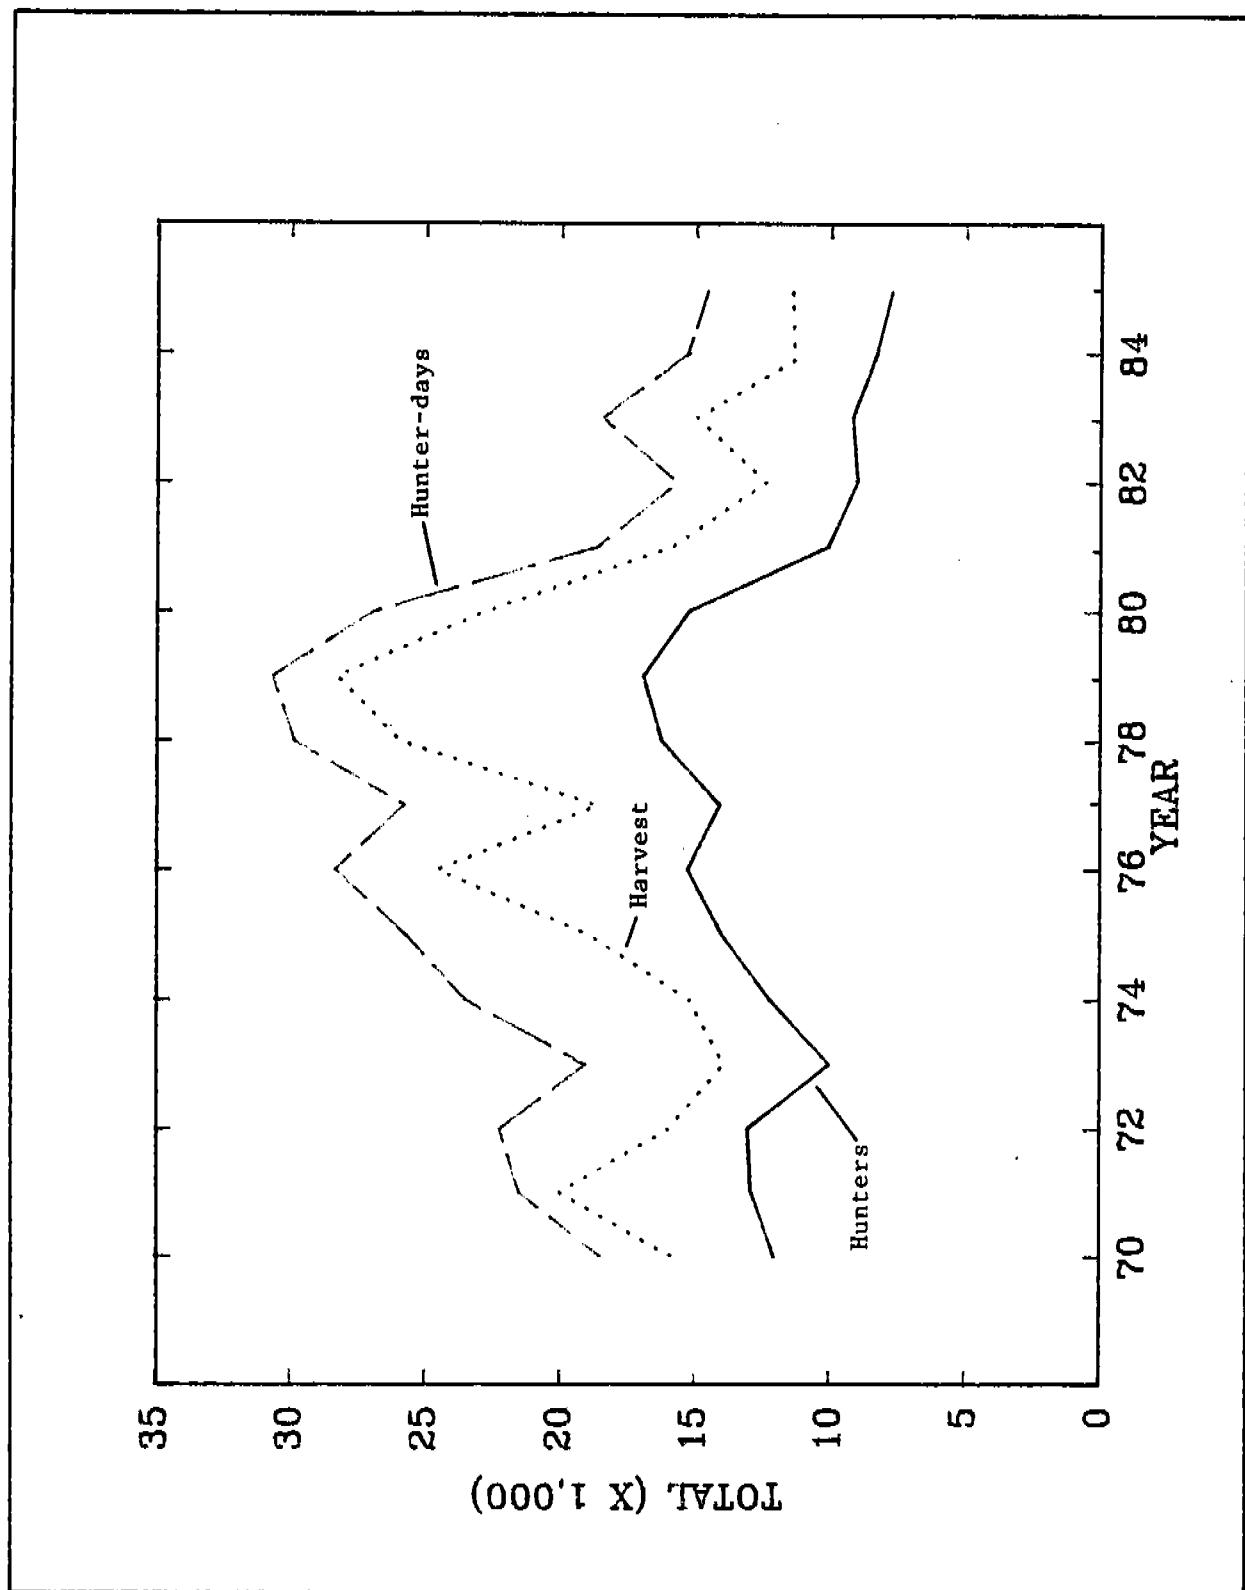

Figure 1. Statewide trend of sage grouse harvest statistics.

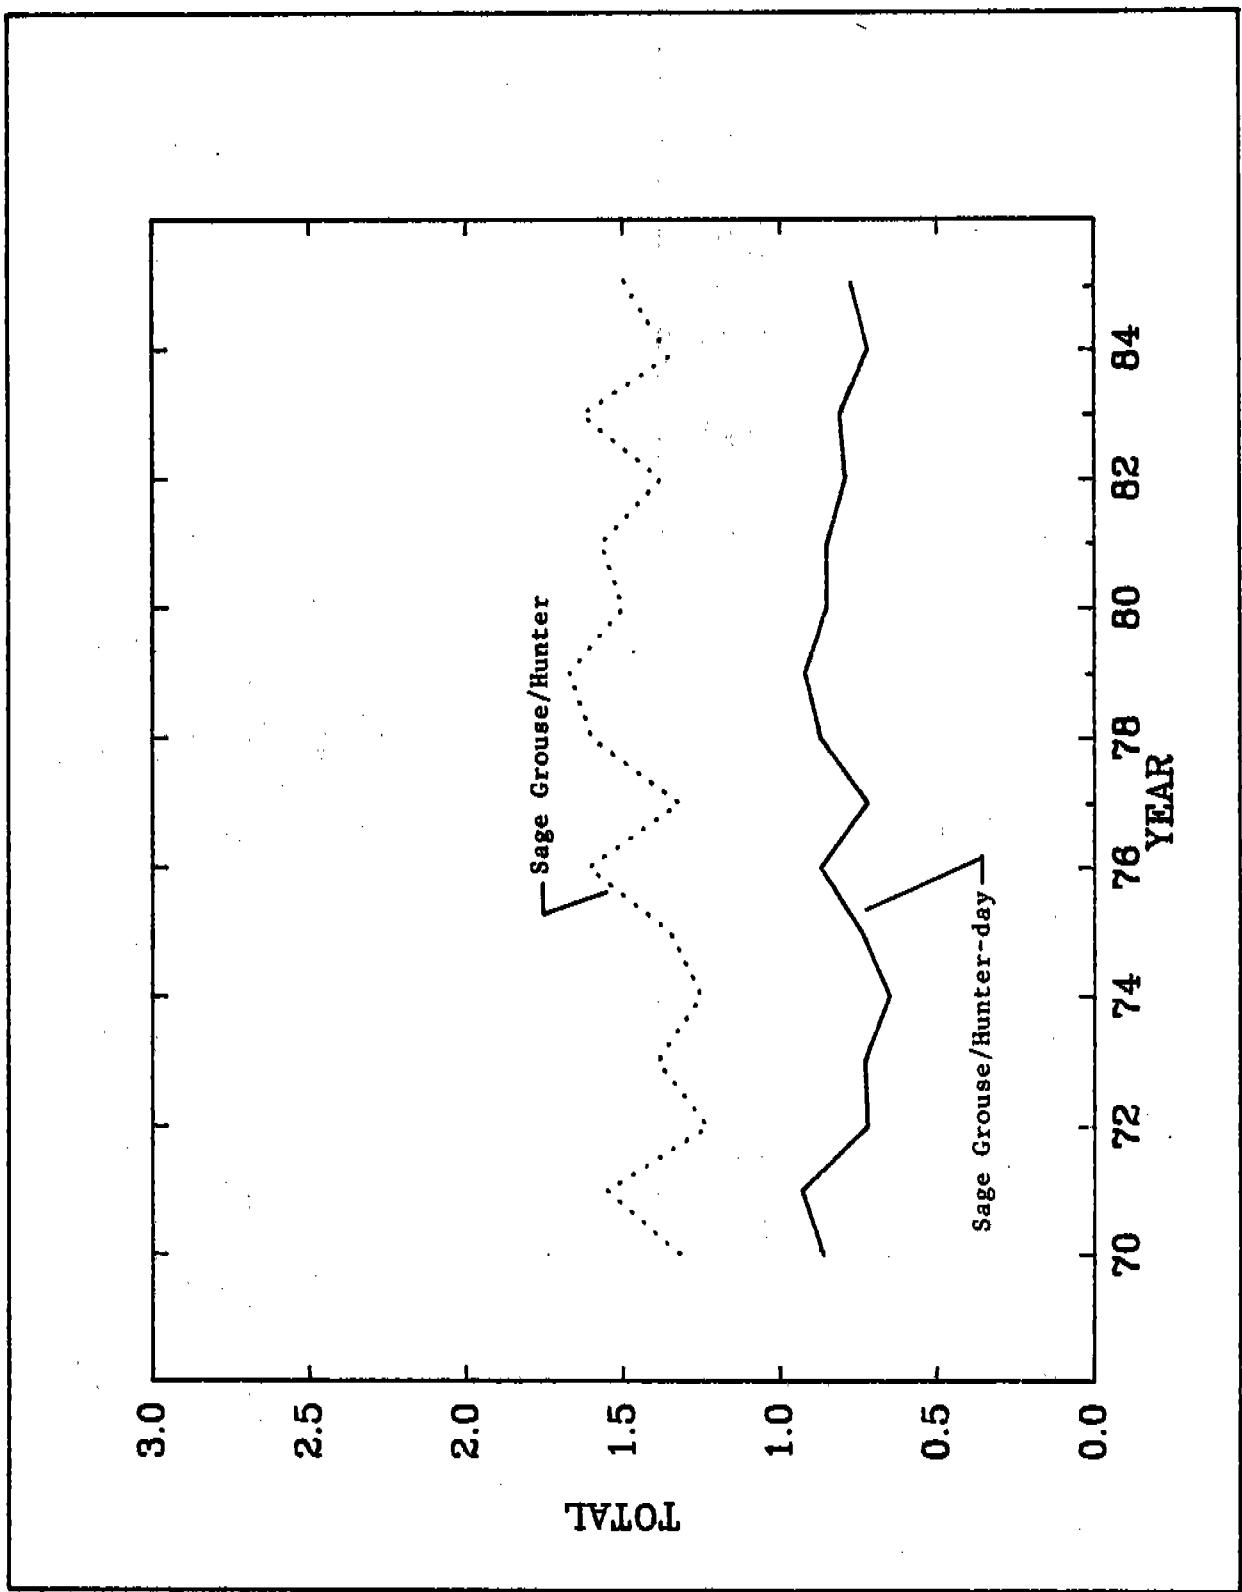

Figure 2. Statewide trend of sage grouse harvest statistics.

FOREST GROUSE

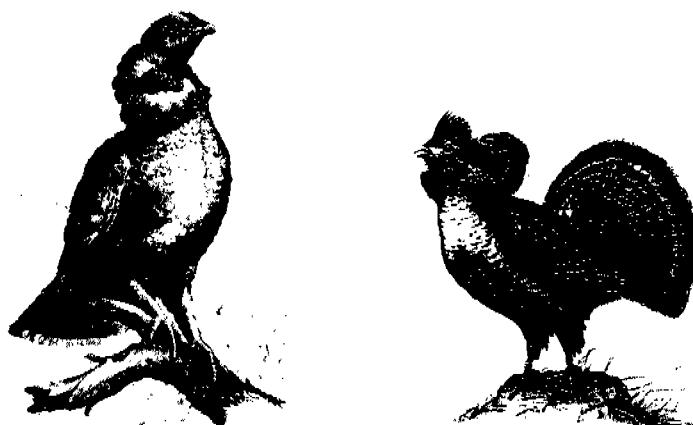

SUMMARY

Judging from harvest statistics for the fall of 1984, the 1985 breeding populations of both ruffed and blue grouse were lower than average, making the fourth consecutive year of below average breeding populations. Production of ruffed grouse appeared to be good even though total populations are depressed. When compared to the lack of ruffed grouse observed during brood surveys in 1984, the observation of 61 ruffed grouse including 10 broods in 1985 suggest a slight increase in abundance. Harvest data confirmed this conclusion.

Production of blue grouse increased from 1984 but remained below the 10-year average. Blue grouse observed per 100 hours of effort increase 33 percent above average. A total of 78 forest grouse broods were observed during 1985 compared with 33 in 1984 and 69 in 1983.

Harvest statistics indicated a higher density of forest grouse. Total harvest increased from 20,396 in 1984 to 23,097 in 1985, a 13 percent increase. Total hunters also increased 10 percent in 1985 compared to 1984, and days afield increased from 27,244 to 31,290.

Field bag check data confirmed the increased success shown by the questionnaire. Limited blue grouse wing data also indicated an increase in both young per 100 adults and young per 100 hens in the Northern region.

Brood Counts

Ruffed Grouse

Results of the annual random brood survey for 1985 are shown in Table 1 of this section. Long-term trends of young-adult ratios, mean brood size and ruffed grouse observed per 100 hours are found in Tables 2-4. A summary of effort expended on ruffed and blue grouse brood counts combined is shown in Table 9. Survey results for 1985 compared to 1984 and the previous 10-year average follow:

	<u>1985</u>	<u>Percent change from 1984</u>	<u>Average</u>
Total ruffed grouse observed	61	+100	-65
Young per 100 adults	336	—	+5
Mean brood size	4.70	—	+3
Ruffed grouse observed per 100 hours	22	—	-24
Total hours effort	279	-9	-65

Harvest statistics for 1984 indicated a below average breeding population for 1985.

Effort on brood surveys continued to decrease significantly, and was 9 percent less than 1984 and 65 percent below average.

Since no ruffed grouse were observed during the 1984 summer inventory period, 1985 data cannot be compared to 1984. However, in 1985 grouse observed per 100 hours was 24 percent below average, while mean brood size was 3 percent above average indicating good production.

Blue Grouse

Results of the annual random brood survey for 1985 are shown in Table 5 of this section. Long-term trends of young-adult ratios, mean brood size and blue grouse observed per 100 hours are found in Tables 6-8. Survey results for 1985 compared to 1984 and the 10-year average follow:

	<u>1985</u>	<u>Percent change from 1984</u>	<u>Average</u>
Total blue grouse observed	388	+131	-31
Young per 100 adults	229	+21	-4
Mean brood size	3.56	+12	-11
Blue grouse observed per 100 hours	101	+84	+33
Total hours effort (forest grouse)	384	+26	-52

Harvest statistics for 1984 indicated the blue grouse breeding population for 1985 was significantly below average.

All indications from the 1985 summer surveys on blue grouse were that production increased 21 percent from 1984, but remained below the average.

Total observations increased 131 percent, partially the result of increased effort. The number of grouse observed per 100 hours of effort increased from 1984 and was 33 percent above average.

Wing samples collected at checking stations were limited, but indicated a slightly increased production rate in the Northern Region.

Harvest

Hunter Questionnaire

Results of the 1985 forest grouse (ruffed and blue grouse combined) hunter questionnaire are shown in Table 10. Long-term trends of forest grouse bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 11-13 and total statewide harvest statistics in Table 14. Harvest statistics for 1985 compared to 1984 and the 22-year (1963-84) average follow:

		<u>Percent change from</u>	
	<u>1985</u>	<u>1984</u>	<u>Average</u>
Forest grouse hunters	12,646	+10	-15
Forest grouse harvested	23,097	+13	-34
Hunter-days afield	31,290	+15	-11
Forest grouse per hunter-day	0.74	-1	-26
Forest grouse per hunter	1.83	+3	-22
Percent ruffed grouse	37.7	+14	-3
Percent blue grouse	58.1	-6	+7
Percent unidentified	4.2	-12.5	-38

Although statewide grouse populations are below average, results from the harvest questionnaire confirmed increasing forest grouse population levels as implied by summer surveys. Total harvest increased 13 percent from the near record low harvest of 1984. However, hunter success (grouse per hunter-day) was 26 percent below average, and the number of grouse harvested per hunter was 22 percent below average. Hunter pressure increased considerably from 1984, but was still 11 percent below the 22-year average.

Field Bag Checks

A summary of field bag check data for 1985 is found in Table 15. Hunter success trends determined via this method are shown in Table 16. Results of the 1985 survey compared to 1984 and the 10-year (1975-84) average follow:

		<u>Percent change from</u>	
	<u>1985</u>	<u>1984</u>	<u>Average</u>
Total hunters checked	480	+17	-70
Total hours hunted	1,882	+24	-70
Forest grouse per hunter (complete hunts)	0.57	+6	+11
Forest grouse bagged per 100 hours	15	+7	0
Average hours per hunter-day (complete hunts)	4.12	+8	+3
Hours hunted per grouse bagged (complete hunts)	7.2	+1	-13

QUAIL

SUMMARY

The 1985 breeding populations of California and Gambel's quail were slightly lower than 1984, and considerably less than average.

However, production of Gambel's quail increased from 1984, but remained well below average. Likewise, quail observation trends remain below average in most areas of the state.

Statewide harvest statistics, when compared to 1984, showed a decrease in total hunters and total harvest. Hunter success (birds per hunter-day) remained below average statewide. There was an increase in hunter days afield but decrease in total harvest of Gambel's quail reported in Washington County.

Brood Counts

Results of the annual random brood counts for 1985 are shown in Table 1 of this section. Long-term trends of young-adult ratios, mean brood size and quail observed per 100 hours are shown in Tables 2-4. Survey results for 1985 compared to 1984 and the previous 10-year average follow:

		<u>Percent change from</u>	
	<u>1985</u>	<u>1984</u>	<u>Average</u>
Total quail observed	258	+83	-61
Young per 100 adults	473	+122	+95
Mean brood size	8.62	+70	+23
Quail observed per 100 hours	645	+117	+11
Total hours effort	40	-16	-64

Harvest statistics for 1984 indicated a decreased breeding population of quail statewide; breeding populations of California quail decreased significantly. However, Gambel's quail in Washington County showed a slight increase in breeding population.

Gambel's quail call counts on the west slope of Beaver Dam Mountains were discontinued in 1980.

Brood counts indicated good production of both California and Gambel's quail. Production increased significantly from 1984 and was well above average.

Harvest

Results of the annual hunter questionnaire for 1985 are shown in Table 5. Long-term trends of quail bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 6-8, and total statewide harvest statistics in Table 9.

Comparison of the 1985 season to 1984 and the previous 26-year average follow:

		<u>Percent change from</u>	
	<u>1985</u>	<u>1984</u>	<u>Average</u>
Quail hunters	3,065	-16	-53
Quail harvested	7,051	-15	-62
Hunter-days afield	7,994	-18	-51
Quail per hunter-day	0.88	+4	-22
Quail per hunter	2.30	+1	-18

Harvest for 1985 decreased 15 percent from 1984 and 62 percent below average.

Hunter success and total harvest for Washington County (Gambel's quail) decreased 37 percent and 35 percent, respectively from 1984. Hunter-days afield increased 5 percent. Approximately 36 percent of the statewide harvest of quail was taken in Washington County during 1985 compared to 46 percent in 1984 and nearly 24 percent in 1983.

Long-term quail harvest statistics are shown in Figure 1.

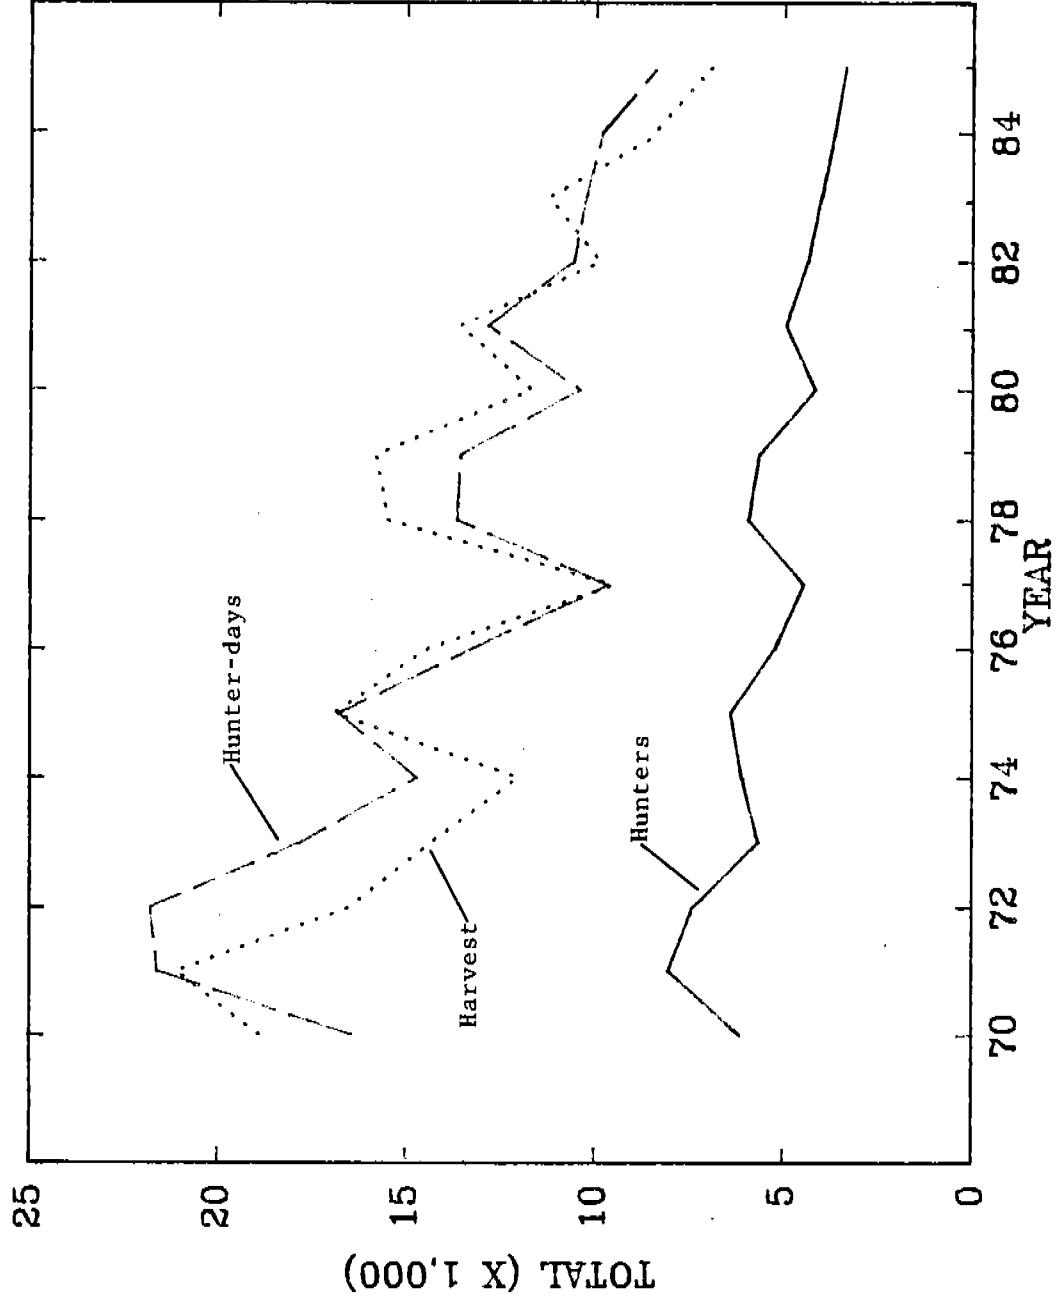

Figure 1. Statewide trend of quail harvest statistics.

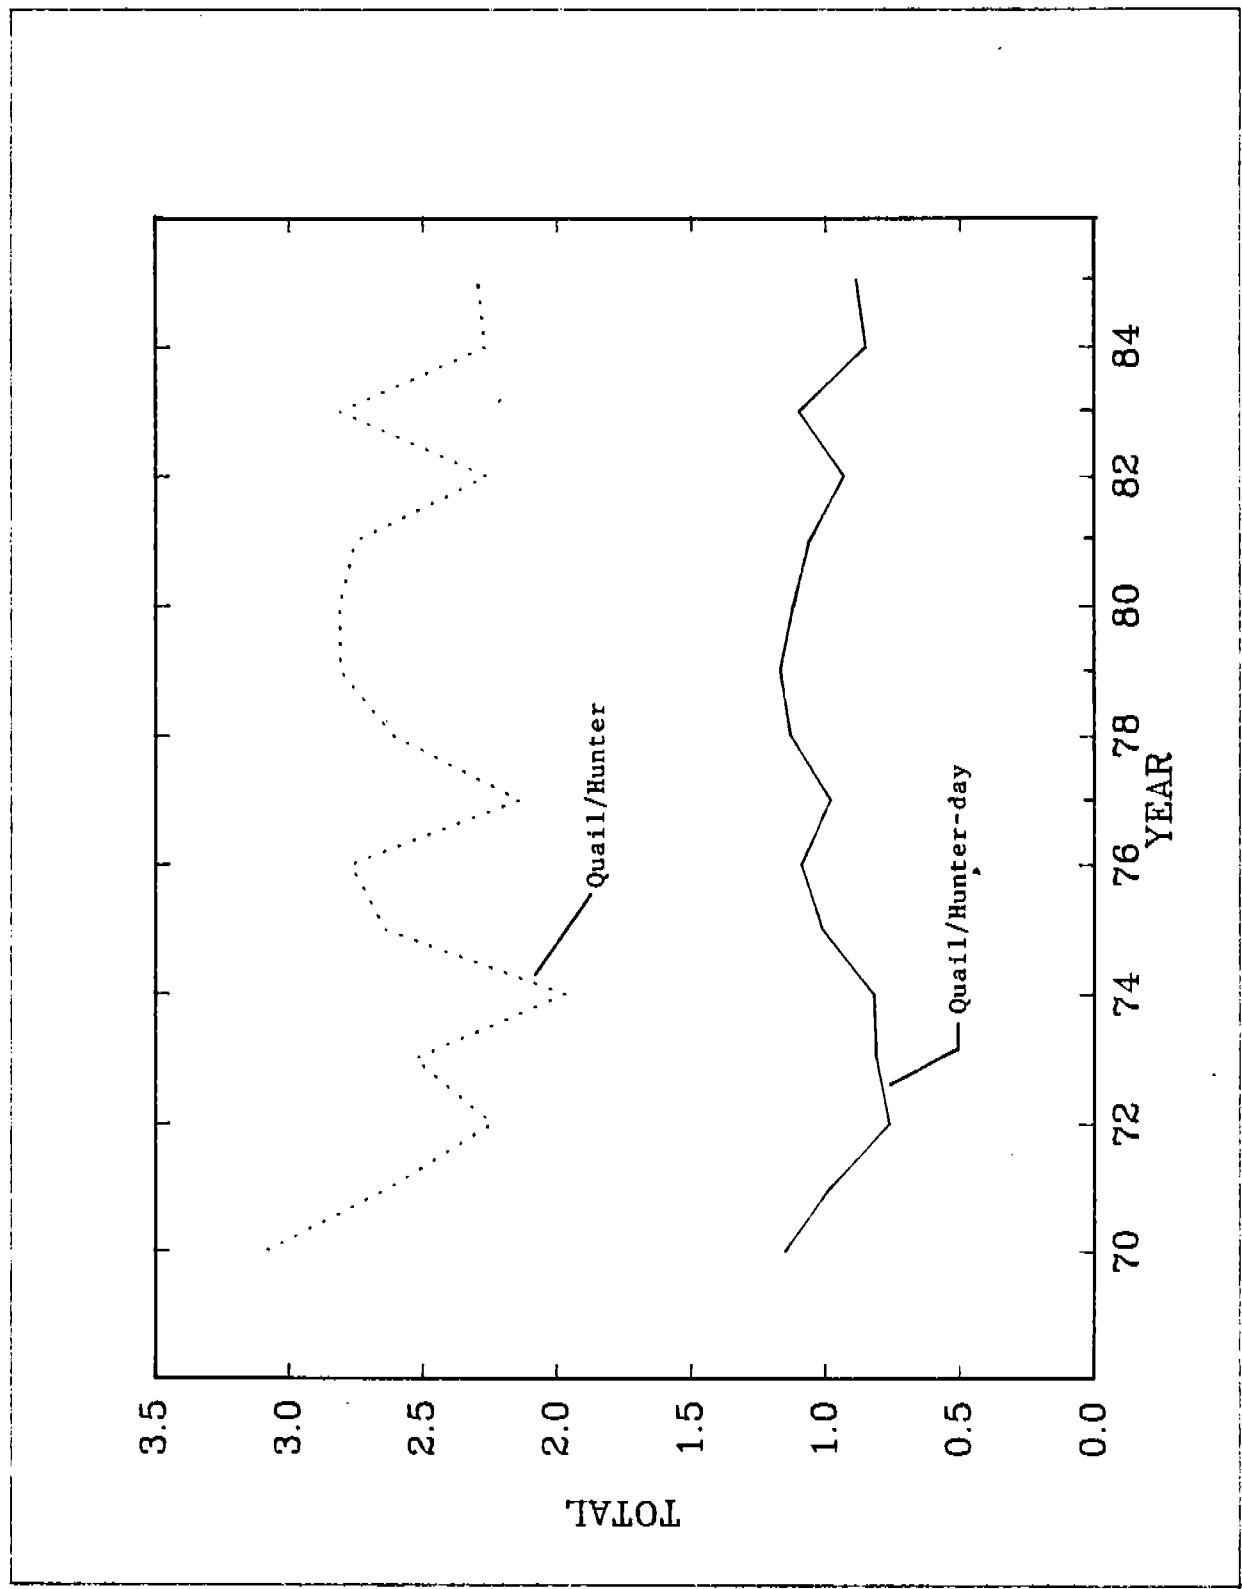

Figure 2. Statewide trend of quail harvest statistics.

HUNGARIAN PARTRIDGE

SUMMARY

Harvest data for 1984 indicated that 1985 breeding population densities were well below 1984 and the long term average. The total lack of brood data allowed no estimates of Hun densities for 1985.

The 1985 hunt indicated decreased hunting pressure on Huns when compared to 1984. The number of hunters afield and Huns harvested also decreased significantly in 1985. The hunter-days afield decreased 30 percent from 1984. Total hunters, days afield and harvest remained significantly below the long-term average. Hunter success was 64 percent below the long-term average.

S

Brood Counts

Results of the annual random brood counts for 1985 are shown in Table 1 of this section. Long-term trends of young-adult ratios, mean brood size and Huns observed per 100 hours are shown in Tables 2-4. Results of the survey for 1985 compared to 1984 and the previous 10-year average follow:

	<u>1985</u>	<u>Percent change from 1984</u>	<u>Average</u>
Total Huns observed	0	--	--
Young per 100 adults	--	--	--
Mean brood size	--	--	--
Huns observed per 100 hours	--	--	--
Total hours effort	38	-83	-56

Harvest data for 1984 indicated a significantly below average breeding population for 1985.

The hours of effort decreased 83 percent from 1984, and 56 percent below average. No hungarian partridge were observed during the summer inventory counts, therefore, no data comparisons could be made.

Harvest

Hunter Questionnaire

Results of the annual hunter questionnaire for 1985 are shown in Table 5. Long-term trends of Huns bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 6-8 and total statewide harvest statistics in Table 9. The 1985 season compared to 1984 and the previous 26-year average follow:

	<u>1985</u>	<u>Percent change from 1984</u>	<u>Average</u>
Hungarian partridge hunters	1,157	-24	-70
Hungarian partridge harvest	707	-48	-92
Hunter-days afield	2,314	-30	-76
Huns per hunter-day	0.31	-24	-64
Huns per hunter	0.61	-31	-72

Hungarian partridge hunting pressure decreased 30 percent, while success decreased 24 percent during 1985 as compared to 1984. Harvest was 92 percent below the 26-year average and the lowest on record since 1959.

Field Bag Checks

Results of the survey for 1985 are shown in Table 10. Hunter success trends determined via this method are shown in Table 11. Indices obtained for 1985 compared to 1984 and the previous 10-year average follow:

	<u>1985</u>	<u>Percent change from 1984</u>	<u>Average</u>
Total hunters checked	505	--	+1,430
Total hours hunted	3,076	--	+2,341
Huns per hunter (complete hunts)	0.16	--	-72
Huns bagged per 100 hours	3	--	-81
Average hours per hunter-day (complete hunts)	6.1	--	+91
Hours hunted per Hun bagged (complete hunts)	38.4	--	+412

Field bag check data submitted in 1985 was for Box Elder County only, and was collected at the game checking station at Snowville, Utah. Many of these hunters are hunting sagegrouse, but Huns are often found in the same areas.

WILD TURKEY

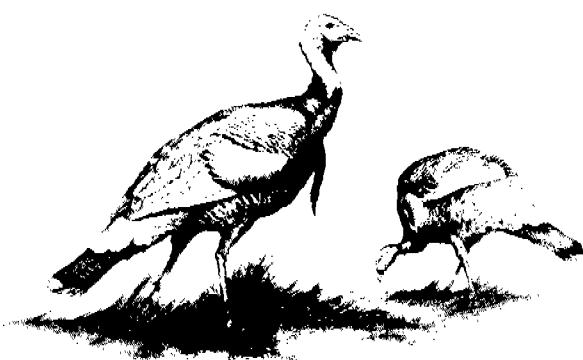

SUMMARY

Turkey populations have improved considerably on all units during the past two years, and the increasing numbers are reflected in the reported observations and the annual harvest.

Hunter success and turkey observation data for the 1985 spring season indicated that the East Zion area had another year of increasing turkey population. The Boulder Mountains and LaSal Mountains also indicated growing populations. However, the remaining units of the state were closed to hunting. Rio Grande turkeys were released on Pine Valley mountain in 1984, but the population was not considered to be huntable in 1985.

Spring hunting pressure was up from 1984 but hunter success was down 40 percent. A fall turkey hunting season was not held in 1985. A total of 41 Tom turkeys were harvested in the spring hunt of 1985 compared to 43 taken in 1984. Observations of turkey increased in 1985, with most observations again made on the East Zion area.

Precipitation and temperatures in south-central Utah were slightly above normal in April, May and June. The effect on production was not determined because of limited data, however, production appeared to be good.

Brood Counts

Annual random brood counts have been conducted each year since the introduction of turkeys into Utah in the early 1950's; however, success in finding broods has usually been poor. Sample sizes have generally been too low to meaningfully indicate relative density or production from year to year. Spring harvest data for 1985 indicated good breeding populations on all units, but harvest decreased 5 percent from 1984.

During 1985, only one turkey brood with 3 young was observed in Grand County. A total of 13 adults and 12 young were observed during the inventory period on the LaSal Mountains. No additional observation data was submitted from the Southern Region.

Harvest

Spring Gobbler Season

Results of the 1985 spring season are shown in Table 1 of this section. The trend of these data since the first spring season in 1967 is shown in Table 2. The 1985 spring season compared to 1984 and the previous 18-year average follow:

	<u>1985</u>	<u>Percent change from 1984</u>	<u>Average</u>
Permits sold	314	+65	+120
Hunters afield	270	+60	+108
Turkeys harvested	41	-5	+193
Hunter-days afield	747	+55	+128
Percent hunter success	15	-40	+36
Turkeys bagged per hunter-day	0.96	-33	+50
Percent of hunters who observed turkeys	52	-28	+37

Permit sales and hunters afield increased from 1984 and were well above average. Although the total harvest decreased from 43 in 1984 to 41 in 1985, harvest remained 193 percent above the 18 year average. The proportion of hunters who reported having observed turkeys decreased 28 percent below the 1984 level but 37 percent above average. The East Zion unit again accounted for 49 percent of the hunting pressure based on hunter-days afield.

Approximately 14 percent of the turkey hunters used rifles during the spring turkey season, and 7 turkeys were harvested with a rifle. Six percent of the hunters used archery tackle but were unsuccessful in taking a turkey.

The trend of spring turkey harvest statistics is shown in Figure 1.

Fall Season

Fall turkey hunts were not authorized in Utah during 1985. However, data of fall seasons through 1984 are shown in Tables 4-9. The statewide summary of fall harvest statistics is presented in Table 10.

		<u>Percent change from</u>	
	<u>1985</u>	<u>1984</u>	<u>Average</u>
Permits sold	0	--	--
Hunters afield	0	--	--
Turkeys harvested	0	--	--
Hunter-days afield	0	--	--
Percent hunter success	0	--	--
Turkeys bagged per hunter-day	0	--	--
Percent of hunters who observed turkeys	0	--	--

The trend of fall harvest statistics through 1984 is shown in Figure 2.

*Based on the number of hunters bagging one or more turkeys.

**Total permits are sold on a statewide basis and not by unit.

***Note the Pine Valley Mountains Unit was closed by emergency action in 1984 and by amendment to the proclamation in 1985 to protect Rio Grande turkeys released on the area in February 1984.

WHITE-TAILED PTARMIGAN

SUMMARY

The Columbian sharp-tailed grouse is one of four species of grouse native to Utah. Sharptails were formerly abundant in the valley and foothill areas of northern and central Utah. Sharp-tailed grouse habitats were the most attractive areas for agricultural development and grazing. As a result, 'sharp-tail' habitat was directly converted to farmland or was seriously impacted by heavy grazing.

Because of habitat loss, sharptails have been extirpated from most of their former range and are now found only in extreme northern Utah, including Box Elder, Cache, Morgan and Weber counties.

In Utah, sharp-tailed grouse were completely protected from hunting from 1925-1973. Beginning in the early 1970's, field reports from various individuals and observations by Division personnel indicated that sharptails were becoming more numerous in several areas. It was felt, at this time, that limited hunting was justified. Limited hunting was legalized in 1974 and continued through 1979. However, due to a decline in observations during the 1980 spring and summer inventory period, the entire state was closed to hunting sharptails, and remained closed through 1985.

The Division has done fairly extensive fieldwork on sharptails since 1975. This work has centered on locating populations and the associated dancing grounds, evaluating habitat use, examining seasonal migration patterns and monitoring population trends.

Current management of sharptails includes counting of known dancing grounds, searches for new dancing grounds, brood counts and collection of harvest information.

Beginning in 1979, all sharptail hunters were required to obtain a free "Sharp-tailed Grouse Hunting Permit." Questionnaires were sent to all permittees following the season and results were obtained. Harvest figures are not available for the years 1974-1978, but field observations indicate that hunting pressure and harvest were fairly constant during that period and comparable to 1979.

There was no legal harvest of sharp-tailed grouse from 1980 through 1985. Populations have remained down since 1978. Severe winters and loss of habitat have severely reduced sharp-tailed grouse numbers in northern Utah.

SHARP-TAILED GROUSE

SUMMARY

The white-tailed ptarmigan (Lagopus leucurus) was introduced into the Uinta Mountains of northern Utah in 1976 with the release of birds captured in Colorado. The initial transplant consisted of 22 paired birds released in June 1976. A second release of 35 mixed young and adults was accomplished in September of that same year.

This successful transplant was the result of a cooperative effort of the Utah Division of Wildlife Resources, the Ashley and Wasatch National Forests of the U. S. Forest Service, and the Colorado Division of Wildlife.

The original two releases of white-tailed ptarmigan were made at a point about one-half mile southeast of Gunsight Pass and one mile east of Kings Peak in Painter Basin of the Uinta River drainage. Subsequent studies have shown that the population in Painter Basin has increased to the point that birds may be at carrying capacity. Breeding territory surveys in 1977 indicated reproduction from transplanted birds and the transplanted birds themselves had survived their first year. Presently, birds are known to exist in Henry's Fork, Yellowstone Basin, Gilbert Basin, Atwood Basin, Beaver Basin, Lake Blanchard, Smith's Fork, and Rainbow Basin. Evidence for existence of birds has been found in Rock Creek, Black's Fork, Garfield Basin, and Lake Fork. Presently, ptarmigan are believed to be distributed from Holiday Park (Weber River drainage) on the west to Greendale (Flaming Gorge) on the east. Both sightings were made in winter at unusually low elevations (7,800 ft. & 7,000 ft.).

Surveys on the ptarmigan population will continue with emphasis on documenting habitat expansion. Areas of emphasis will include Samuels Lake in the Uinta River drainage to Deadman Lake in the Dry Fork drainage. Two survey techniques will be used. A breeding territory survey will be conducted from mid- to late June. The brood survey will be conducted from mid- to late August. The technique consists of returning to areas where birds were located in the June survey and searching intensively in likely brood habitat with trained hunting dogs. Chicks will be captured, weighed, banded, and primary molt will determine approximate hatching date. Results of the last 6 years of survey data are located in Tables 1 and 2.

The ptarmigan population has now been subjected to a wide range of weather extremes. The winter of 1976-77 was extremely dry, cold and snowfree, whereas the 1978-79 winter had above average snowfall and a late spring thaw. This was followed (1979-80) by a near record late snow pack and extraordinarily dry summer. Accumulated snowfall was considerably less than normal during the winter of 1980-81 with abundant breeding territories available during the June survey. The winter snowpack of 1981-82 was extremely heavy and the 1982-83 snowpack was above average. The 1983-84 snowpack was below average.

The 1985 spring survey was cancelled because above average snow pack made the upper Henry's Fork and Smith Fork drainages inaccessible. Snowpack was above average and snow melt was slower than normal for June.

Brood surveys were made August 14-22, 1985, on Flat Top Mountain in Henry's Fork, Painter Basin and Joulius Creek. Birds were located in each of the areas surveyed. Four brood were observed and fourteen young were banded. Average brood size was 3.5 young.

Above average precipitation and abundant green forage again seemed to affect distribution patterns of ptarmigan broods in 1985.

Hunter Success

Fifty-five hunters obtained permits to hunt ptarmigan in Utah for the fourth season. An estimated 14 hunters actually hunted with 7 birds reported killed. This was the third year ptarmigan were taken by Utah sportsmen. Two hunters (14 percent of the hunters afield) killed all seven of the harvested ptarmigan. Hunter success was 0.54 birds bagged per hunter-day.

Four of the 14 hunters afield hunted in areas where it was unlikely they would see ptarmigan. Many permits are obtained by sportsmen who think they might hunt during a fishing or elk hunting trip, but don't seriously plan on the ptarmigan hunt.

¹Three territorial males were yearling birds, the result of successful reproduction by released birds in 1976. Two were spring-released birds and two were fall-released.

²An additional 4 males and 1 female were located. Birds from the June 1976 transplant are well represented in the population while only two September released birds have been located. Recruitment from the 1976 and 1977 nesting seasons was evident in the 1978 population.

³A sighting of ptarmigan was reported by a hunter in October 1979. Division Biologists reported droppings at the base of Leidy in the willow on June 25, 1981.

⁴Excessive snow cover precluded access to trail-heads during the June breeding period.

RABBITS AND HARES

SUMMARY

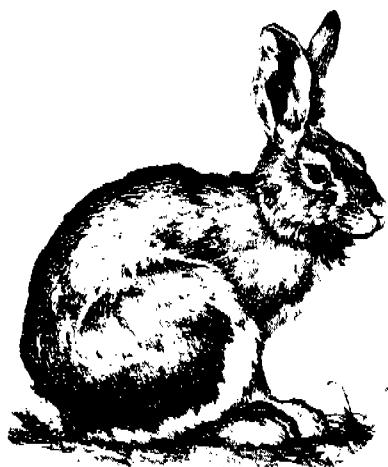

Cottontail Rabbits

An extremely depressed breeding population for 1985 was indicated by the 1984 harvest statistics.

Summer roadside counts also indicated a decreased population density statewide. Harvest statistics indicated 50 percent of the harvest was from the Southern and Southeastern regions, with a total harvest of 31,397 cottontails by 14,059 hunters afield.

Snowshoe Hares

The 1985 snowshoe hare hunting season was the eleventh held since the Legislature provided protected status to this species in 1975.

Harvest statistics for 1985 indicated decreased hunter participation and hunter success. This decrease reflects statewide rabbit populations. Although efforts have been made to educate hunters in the identification of the snowshoe hare and the whitetailed jackrabbit, it is still a potential problem which could bias the snowshoe data.

COTTONTAIL RABBIT

Roadside Counts

Results of the annual roadside counts for 1985 are shown in Table 1 of this section. The trend of cottontails observed per mile and young per 100 adults since 1975 is shown in Tables 2 and 3, respectively. Indices for 1985 compared to 1984 and the 10-year average follow:

	<u>1985</u>	<u>Percent change from 1984</u>	<u>Average</u>
Total miles driven	1,656	+55	-30
Total cottontails counted	211	+24	-77
Cottontails observed per mile	0.13	-19	-65
Young observed per 100 adults	73	-27	-31

An increased, but yet, below average breeding population for 1985 was indicated by 1984 harvest statistics. Production, however, was 27 percent below 1984 and 31 percent below the average.

The cottontail per mile index was down statewide and was 65 percent below the average.

Harvest

Hunter Questionnaire

Results of the 1985 hunter questionnaire are found in Table 4. Trends of cottontails bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county since 1979 are found in Tables 5-7. Trends of statewide harvest statistics are found in Table 8 and Figure 2. Results of the 1985 season compared to 1984 and the 18-year average follow:

	<u>1985</u>	<u>Percent change from 1984</u>	<u>Average</u>
Cottontail hunters	14,059	-24	-47
Cottontail harvest	31,397	-55	-83
Hunter-days afield	48,371	-28	-55
Cottontails per hunter-day	0.65	-36	-58
Cottontails per hunter	2.23	-40	-65

Total hunters, harvest and hunter-days afield, decreased significantly from 1984. Total harvest was 83 percent below average and success decreased to 58 percent below average, indicating a sharply decreased population of cottontails. The winters of 1982-83 and 1983-84 appear to have had a profound effect on the rabbit population statewide. The population crash was apparent in the spring of 1984, and has been confirmed by the 1984 and 1985 harvest data.

Field Bag Checks

Results of the survey for 1985 are shown in Table 9. Trends of hunter success as determined by bag checks are shown in Table 10. Following is a comparison of the 1985 field bag check data to 1984 and the average.

	<u>1985</u>	<u>Percent change from 1984</u>	<u>Average</u>
Total hunters checked	14	-78	-96
Total hours hunted	31	-79	-97
Cottontails per hunter (complete hunts)	0.80	-61	-59
Cottontails bagged per 100 hours	13	-82	-79
Hours per hunter-day (complete hunts)	3.8	+41	+19
Hours per cottontail bagged (complete hunts)	4.8	+269	+151

Field bag check data was limited to the Northeastern region and Millard County. Data from other regions was not obtained.

*Cottontails per hunter based on all hunts.

SNOWSHOE HARE

Harvest

The eleventh annual snowshoe hare hunting season was held statewide in 1985. Results of the 1985 hunter questionnaire are found in Table 11. Trends of snowshoe hares bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) are found in Tables 12-14. The 1985 season compared to 1984 and the 10-year average follow:

	<u>1985</u>	<u>Percent change from 1984</u>	<u>Average</u>
Snowshoe hare hunters	3,365	-11	-42
Snowshoe hares harvested	3,429	-47	-75
Hunter-days afield	9,494	-12	-45
Snowshoes per hunter-day	0.36	-40	-51
Snowshoes per hunter	1.02	-40	-54

Significant misidentification of whitetail jackrabbits as snowshoe hares was anticipated prior to mailing the harvest questionnaire following the first season in 1975. This proved to be the case as a significant harvest of snowshoe hares was reported for counties outside the known range of the species. It was assumed that the problem was statewide, not just confined to those counties.

The 1976 harvest questionnaire was modified in an attempt to better inform respondents concerning the potential for misidentification and aid them in distinguishing between these two varying hares. Comparative reported harvests between 1975 and 1976 suggest that this was accomplished, at least to a significant degree, but the relatively large harvest in counties outside of the snowshoe's range suggested continued confusion. Further refinement was made in the 1977 harvest questionnaire in an effort to more clearly define the snowshoe hare harvest.

In 1978, a leaflet containing pictures and descriptions of the different species of hares found in Utah was mailed with the questionnaire. As a result of the identification leaflet, it is assumed that the data have been more accurate.

Results of the 1985 questionnaire indicate an 11 percent decrease in snowshoe hare hunters and a 47 percent decrease in harvest compared to 1984. This corresponds to the depressed rabbit populations statewide.

It is unknown what proportion of the reported snowshoe harvest is actually whitetail jackrabbits incorrectly identified by the hunters. However, it is believed that identification has been improving as a result of efforts to educate the hunter on the differences between the various species of hares found in Utah.

CLIMATIC REPORTING DIVISIONS AND SELECTED CLIMOGRAPHS

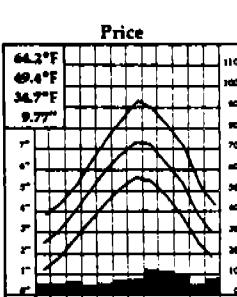

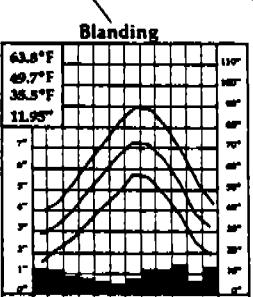

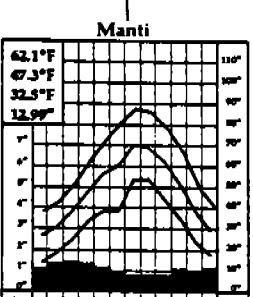

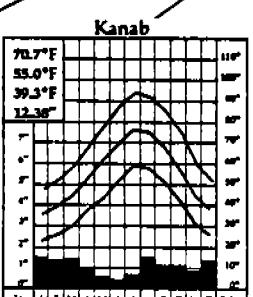

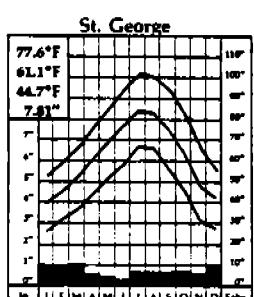

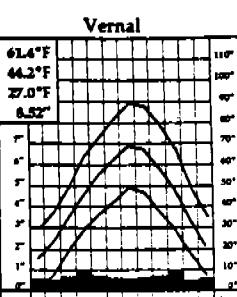

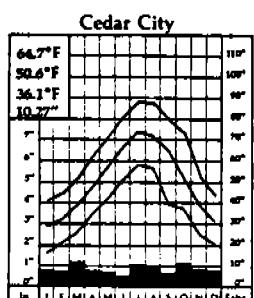

EXPLANATION

- 64.7°F Av. annual max temp.
- 50.5°F Av. annual mean temp.
- 32.5°F Av. annual min temp.
- 9.57" Total annual precip.

Monthly max. temp.
Monthly mean temp.
Monthly min. temp.

NOTE: Data shown represent thirty-year average but not every station spans the same thirty-year period.

For reference, see Bibliography, number 204.

Figure 1. Climographs for selected reporting stations in Utah. Temperatures and precipitation are 30-year averages. Figure is from the Office of Utah State Climatologist, Utah State University, UMC 48, Logan, Utah 84322.

UTAH'S
PRECIPITATION
TRENDS FOR
THE WATER YEARS
1973-74
THROUGH
1983-84

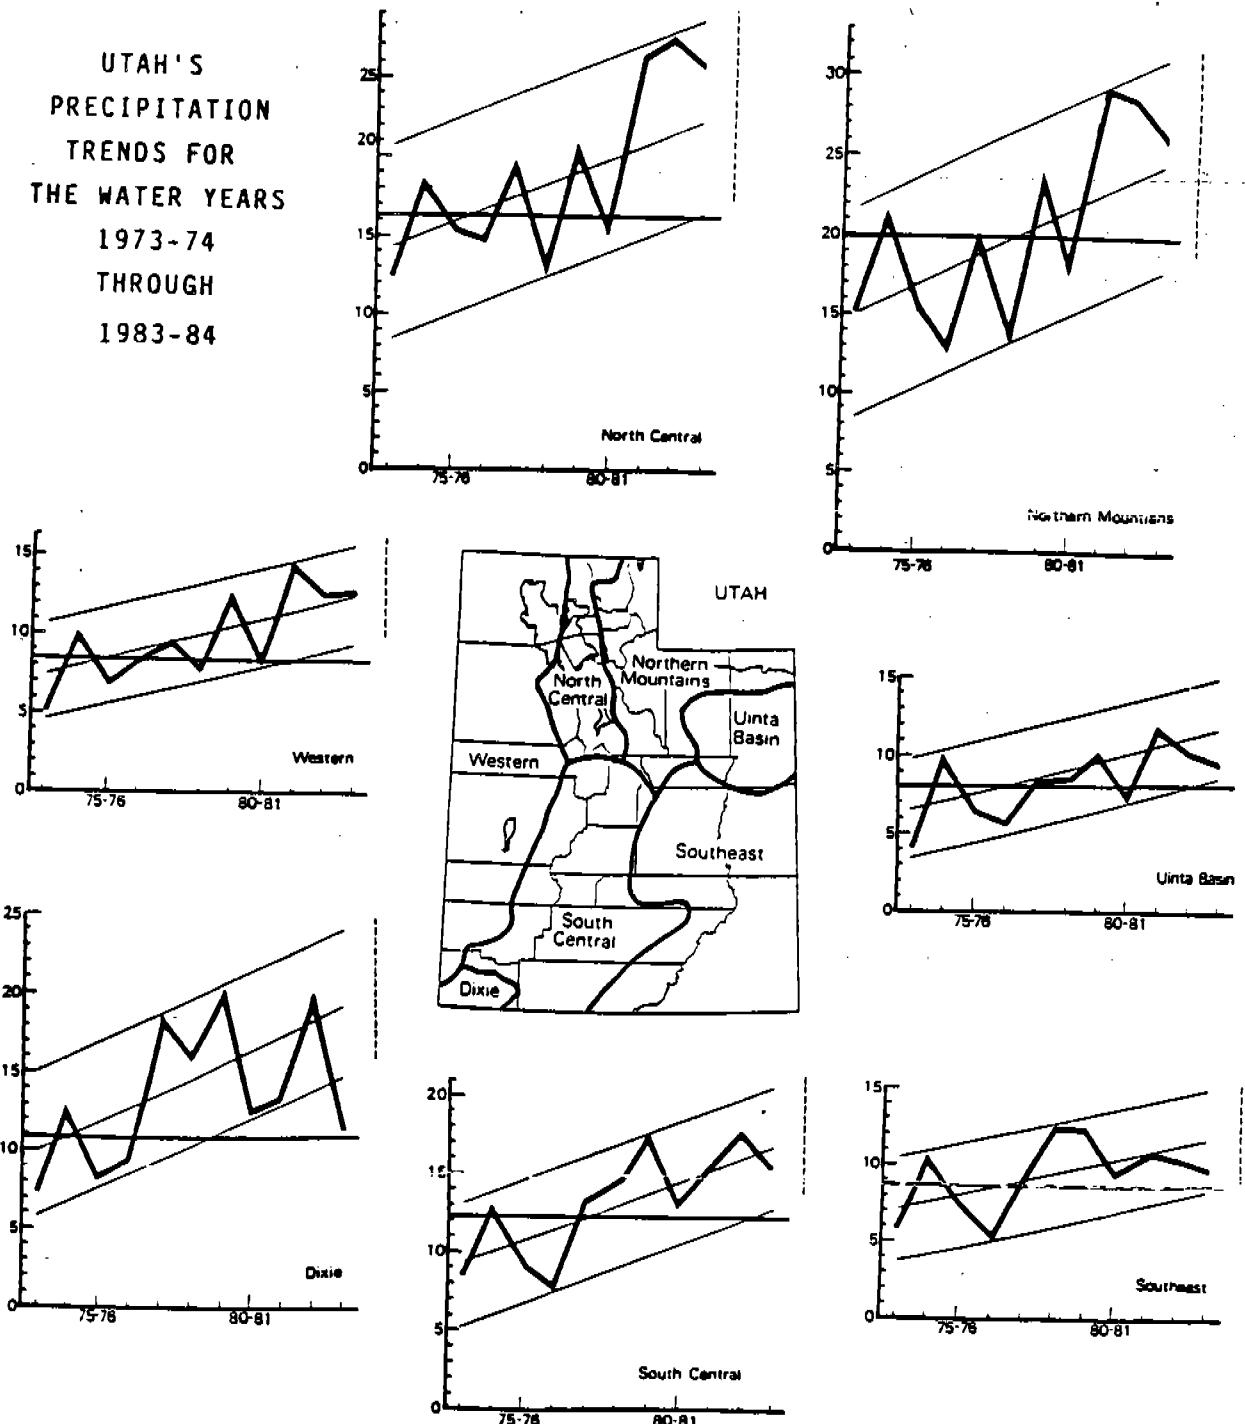

Figure 2. The heavy solid lines connect water-year precipitation accumulations for the period 1973-74 through 1983-84. The heavy horizontal lines indicate the normal precipitation values for the divisions. In addition, there are three fine, solid lines on each graph: the center one is a trend line and the other two are straight lines drawn parallel to the trend lines but far enough removed to enclose all of the precipitation values except for last year's value in the Dixie Division. The broken vertical lines at the right ends of the trend lines show the probable range of values for the 1984-85 water year, assuming that the present trend of wet years continues.

Table 3. Number and percent of total upland game hunters afield who reported hunting each game species during 1980-85.

Species	Number of Hunters					Percent of Total						
	1980	1981	1982	1983	1984	1985	1980	1981	1982	1983	1984	1985

Ptarmigan**	--	--	19	13	20	14	--	--	0.02	0.01	0.02	0.02
Cottontail rabbit	25,156	25,906	26,714	22,467	18,616	14,059	25.1	26.9	27.3	24.8	21.1	17.3
Snowshoe hare	4,048	3,554	4,245	3,544	3,796	3,365	4.0	3.7	4.3	3.9	4.3	4.1
TOTAL HUNTERS***	100,164	96,196	97,705	90,592	88,431	81,119						

*Includes both spring and fall hunts.

**Although wild turkey, band-tailed pigeon, ptarmigan and sharp-tailed grouse harvest was determined by separate questionnaires, it is assumed that these hunters are derived from the same group of hunters who reported hunting other upland game bird species.

***Note: This is not the total of the columns because many upland game hunters hunted more than one species.

Table 4. Percent of hunter trips resulting in failure to bag at least one bird, 1961-85.

Table 6. Season framework for upland game during 1985.

<u>Species</u>	<u>Season Dates</u>	<u>Daily Bag Limit</u>	<u>Possession Limit</u>	<u>Area Open</u>
Pheasant	Nov. 2-10	2 cocks	4 cocks	Statewide
	Nov. 2-15	2 cocks	4 cocks	Box Elder, Cache, Davis, Millard, Sevier and Weber counties.
	Nov. 2-17	2 cocks	4 cocks	Duchesne and Uintah counties.
	Nov. 2-Dec. 1	2 cocks	4 cocks	All state and federal lands (subject to restrictions and closures imposed by administering agencies) in Carbon, Duchesne, Emery, Grand, Juab, San Juan, Sanpete, Tooele, and Uintah counties; and that portion of Wayne County east of Capitol Reef National Park; and Bear River National Wildlife Refuge.
Mourning dove	Sept. 1-30	15	30	Statewide.
Band-tailed pigeon	Sept. 1-30	5	10	Beaver, Garfield, Grand, Iron, Kane, Millard, Piute, San Juan, Sevier, Washington and Wayne counties.
Chukar	Sept. 14, 1985- Jan. 31, 1986	5	10	Beaver, Carbon, Emery, Garfield, Grand, Iron, Kane, Millard, Piute, San Juan, Sevier, Tooele, Washington, Wayne and portions of Box Elder, Juab, Salt Lake and Utah counties (west of I-15).
	Sept. 14-Nov. 30	5	10	Daggett, Duchesne, Sanpete, Uintah and Wasatch counties and those portions of the following counties lying east of Interstate 15: Juab, Salt Lake, and Utah (south of U-189).

Table 6 (continued)

<u>Species</u>	<u>Season Dates</u>	<u>Daily Bag Limit</u>	<u>Possession Limit</u>	<u>Area Open</u>
Sage grouse	Sept. 14-22	3	6	Beaver, Garfield, Iron, Kane, Piute, Sevier, and Wayne counties.
	Sept. 14-22	2	4	Box Elder (part), Daggett, Duchesne (part), Grand, Uintah, and Wasatch (part).
	Sept. 14-20	1	2	Box Elder (part), Cache, Carbon, Emery, Rich, San Juan (part) and Wasatch (part) counties.

The following counties were closed to sage grouse hunting during 1985:

Cache, Davis, Duchesne
(part), Juab, Millard,
Morgan, Salt Lake, San Juan
(part), Sanpete, Summit,
Tooele, Utah, Wasatch
(part), Washington and
Weber.

Forest grouse	Sept. 14- Nov. 30	4 (aggregate)	8 (aggregate)	Statewide.
Quail	Nov. 2-10	5	10	Statewide except Morgan, and Summit counties.
	Nov. 2-17	5	10	Duchesne and Uintah counties.
	Nov. 2-Dec. 31	5	10	Washington County.

Morgan and Summit counties were closed to quail hunting in 1985.

Hungarian partridge	Sept. 14, 1985- Jan. 31, 1986	2	4	Part of Box Elder County.
	Sept. 14-Nov. 30	2	4	Juab (part), Rich, Tooele, Salt Lake (part), and Utah (part) counties.

Table 6 (continued)

<u>Species</u>	<u>Season Dates</u>	Daily Bag Limit	Possession Limit	<u>Area Open</u>
Wild turkey				
Spring hunt	May 3-25		Season limit 1 male turkey	Garfield, Grand, Iron, Kane, Washington (part), Wayne and San Juan (part) counties.
Fall hunt	SEASON CLOSED			
Washington County, west of I-15 was closed to protect transplanted turkeys on the Pine Valley Mountains.				
Ptarmigan	Sept. 7-Oct. 15	4	4	Summit, Daggett, Duchesne and Uintah counties.
Snowshoe hare	Sept. 14, 1985-Jan. 31, 1986	5	10	Statewide.
Cottontail rabbit	Sept. 14, 1985-Jan. 31, 1986	10	20	Beaver, Box Elder (part), Cache, Carbon, Davis, Emery, Garfield, Grand, Iron, Kane, Millard, Piute, San Juan, Sevier, Washington and Wayne counties.
	Sept. 14, 1985-Jan. 31, 1986	5	10	Box Elder (part), Cache, Daggett, Davis, Duchesne, Juab, Morgan, Rich, Salt Lake, Sanpete, Summit, Tooele, Uintah, Utah. Wasatch and Weber counties.

Table 7. Summary of upland game harvest questionnaire returns, 1962-1985

Year	Questionnaires Mailed	Total Returns	Percent	Useable Returns	Percent	Percent of Licensees who did not hunt
